University of Technology

September 2020

Where innovation starts

Goal of this course:

Given: the plant $H(s)$

Design: the controller $C(s)$

The design of $C(s)$ depends on the specific characteristics of $H(s)$

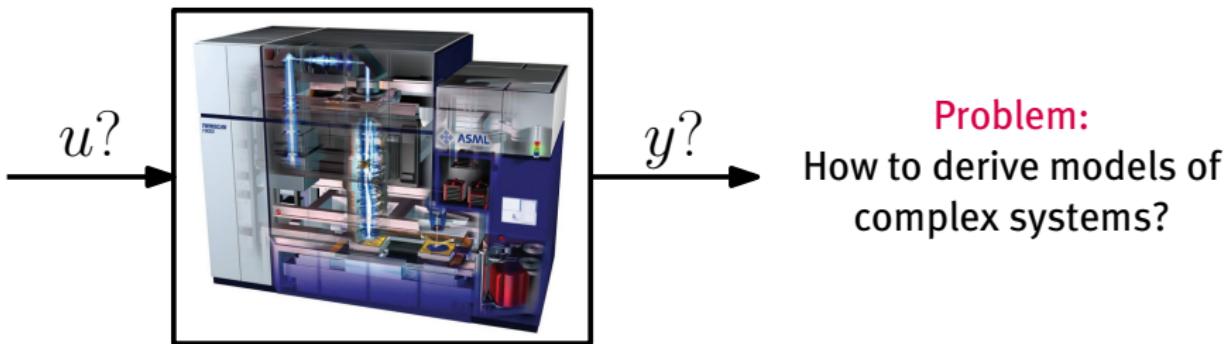

- ▶ But how to design $C(s)$ if $H(s)$ is unknown?

Approach 1: Make a model based on physics, e.g. $H(s) = \frac{1}{ms^2 + ds + k}$

The context: model-based

3/60

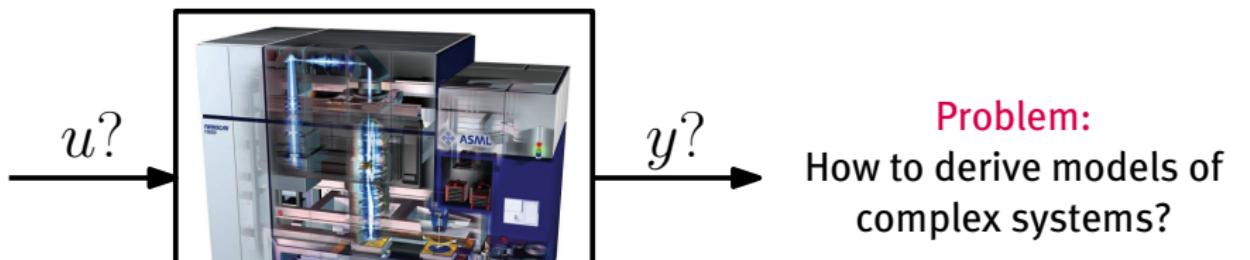

Approach 1: Make a model based on physics, e.g. $H(s) = \frac{1}{ms^2 + ds + k}$

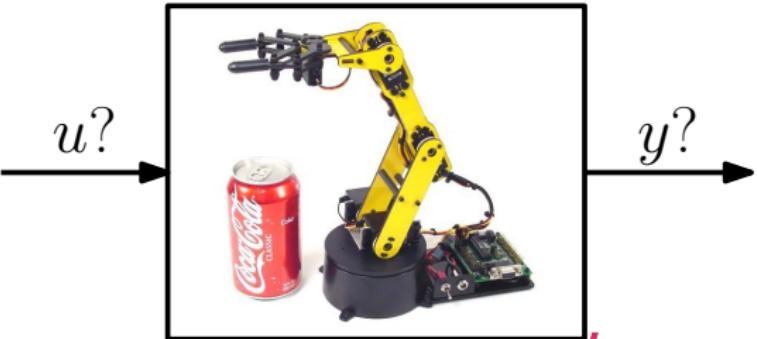

The context: model-based

3/60

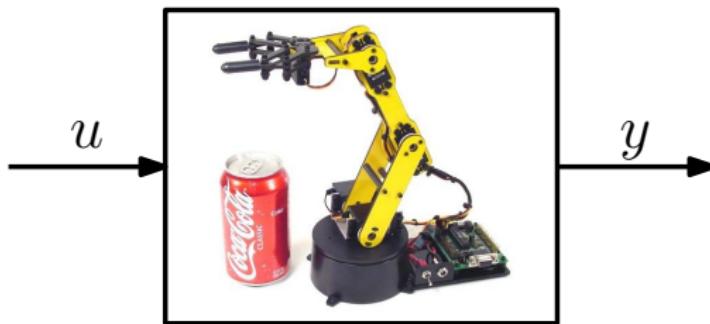

Approach 1: Make a model based on physics, e.g. $H(s) = \frac{1}{ms^2 + ds + k}$

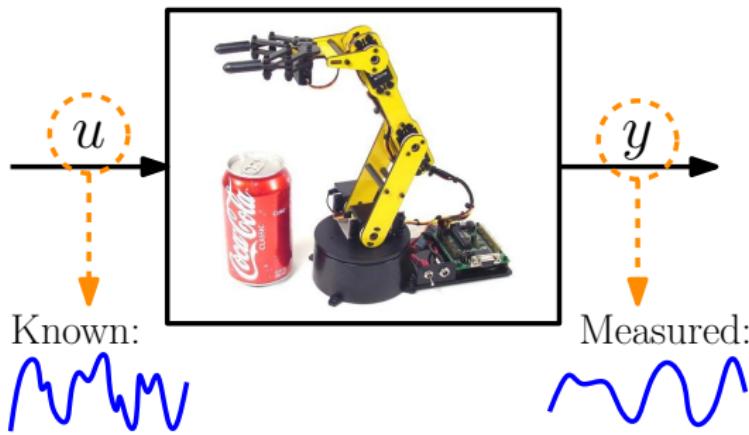

Problem:
How to determine system parameter values?

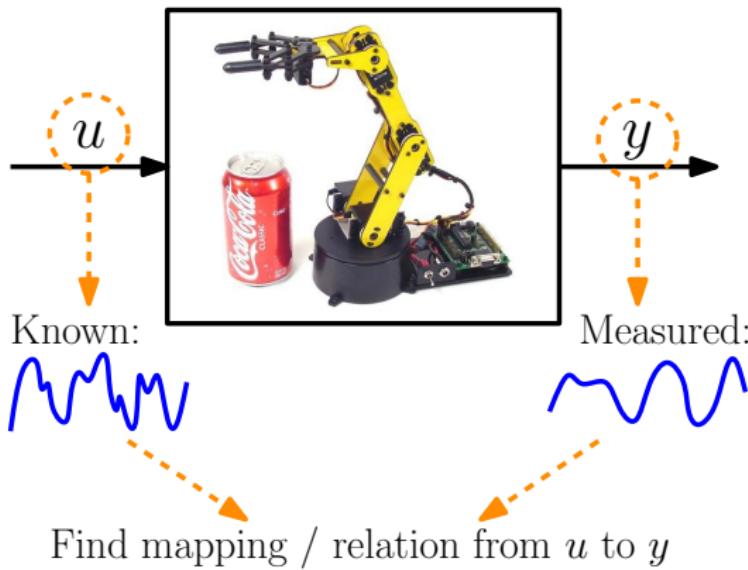

Approach 2: Identify the system by measuring it

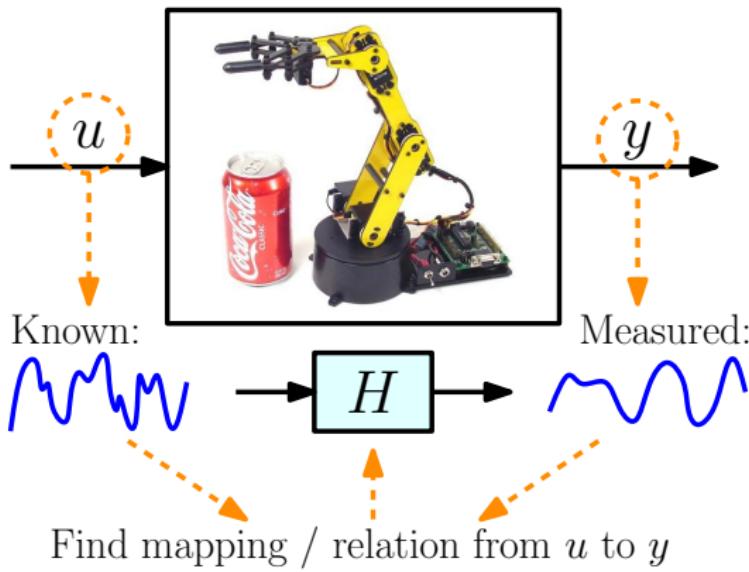

Approach 2: Identify the system by measuring it

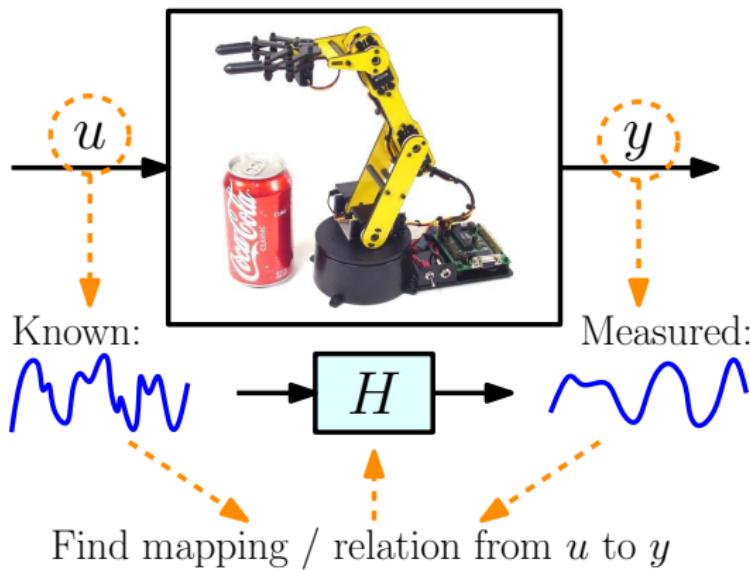

Approach 2: Identify the system by measuring it

Approach 2: Identify the system by measuring it

Approach 2: Identify the system by measuring it

Disadvantage: Obtained parameters do not have any physical meaning

- ▶ Irrelevant for controller design

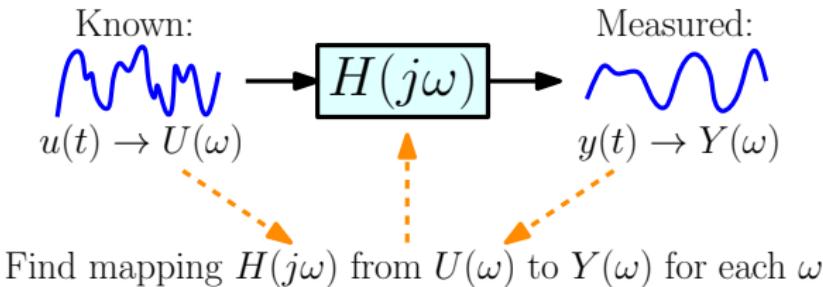

There are various data-based identification techniques:

- ▶ Prediction error identification
- ▶ Subspace identification
- ▶ Minimal realization techniques
- ▶ Frequency response measurements
- ▶ ...

The context: identification

There are various data-based identification techniques:

- ▶ Prediction error identification
- ▶ Subspace identification
- ▶ Minimal realization techniques
- ▶ Frequency response measurements
- ▶ ...

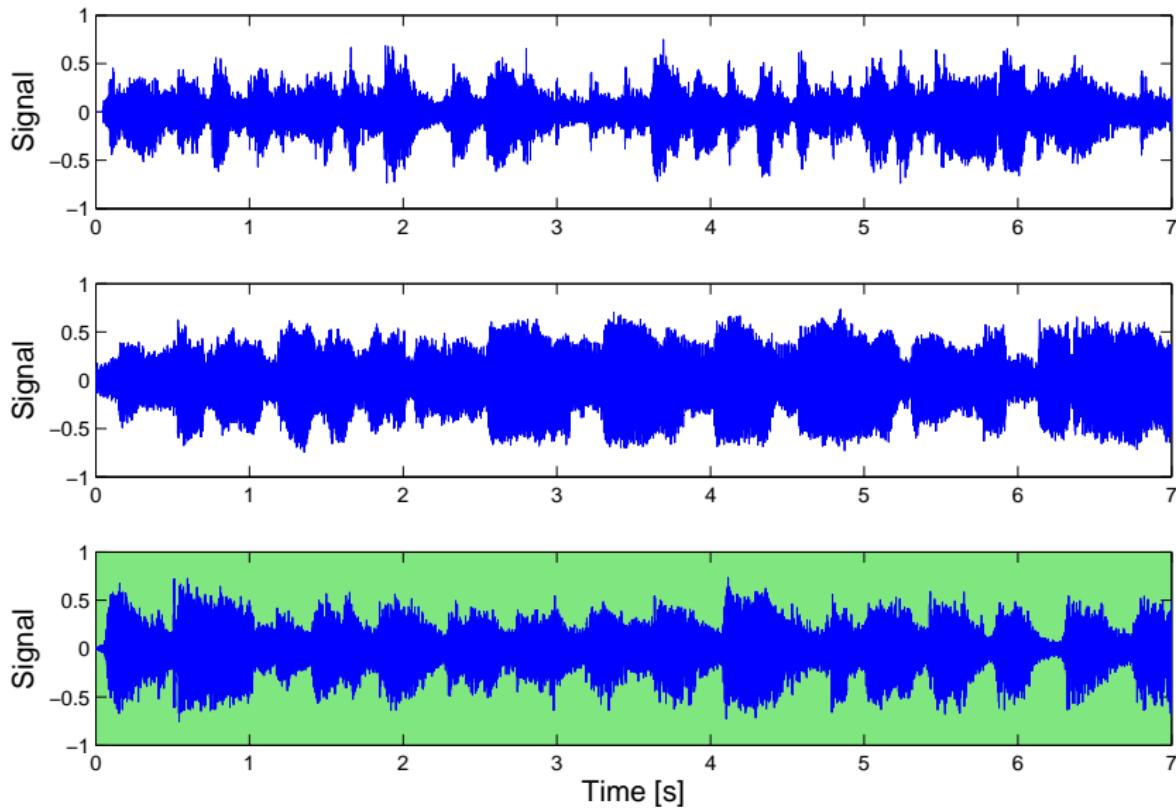

Note: Only applicable for linear systems!

Why frequency domain?

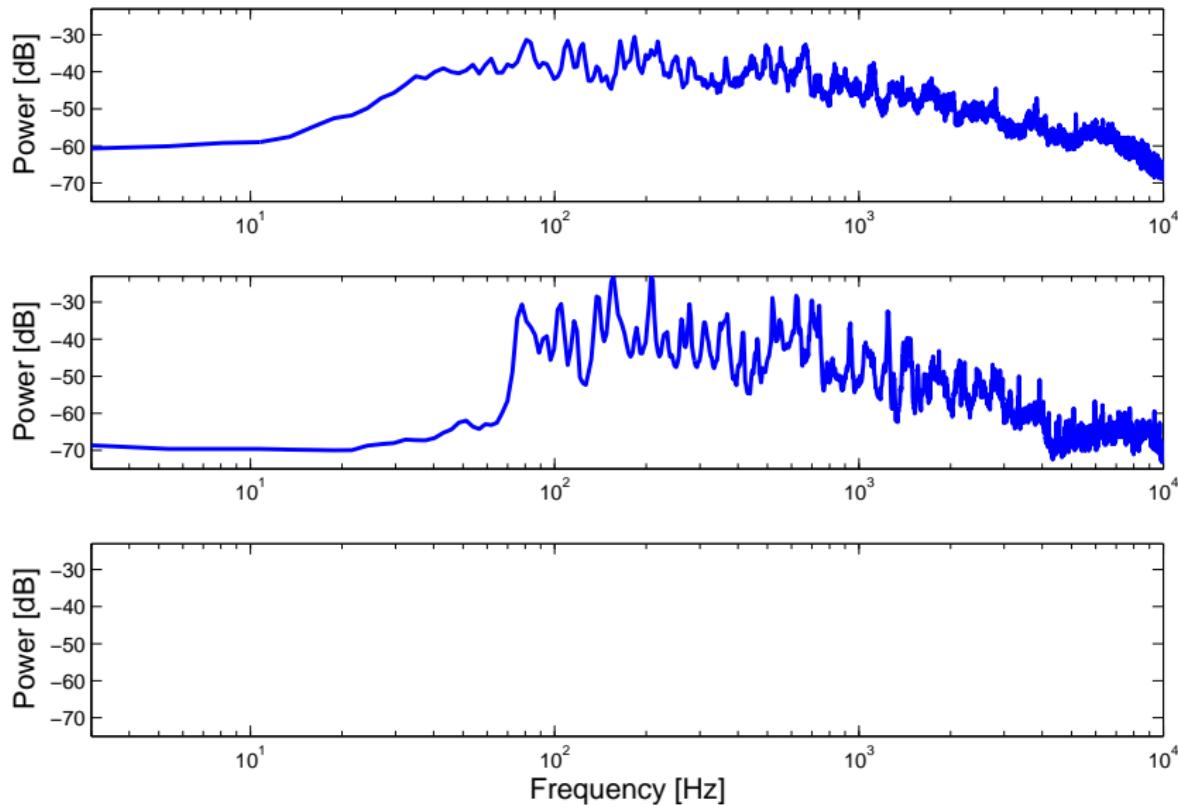

Time vs frequency

7/60

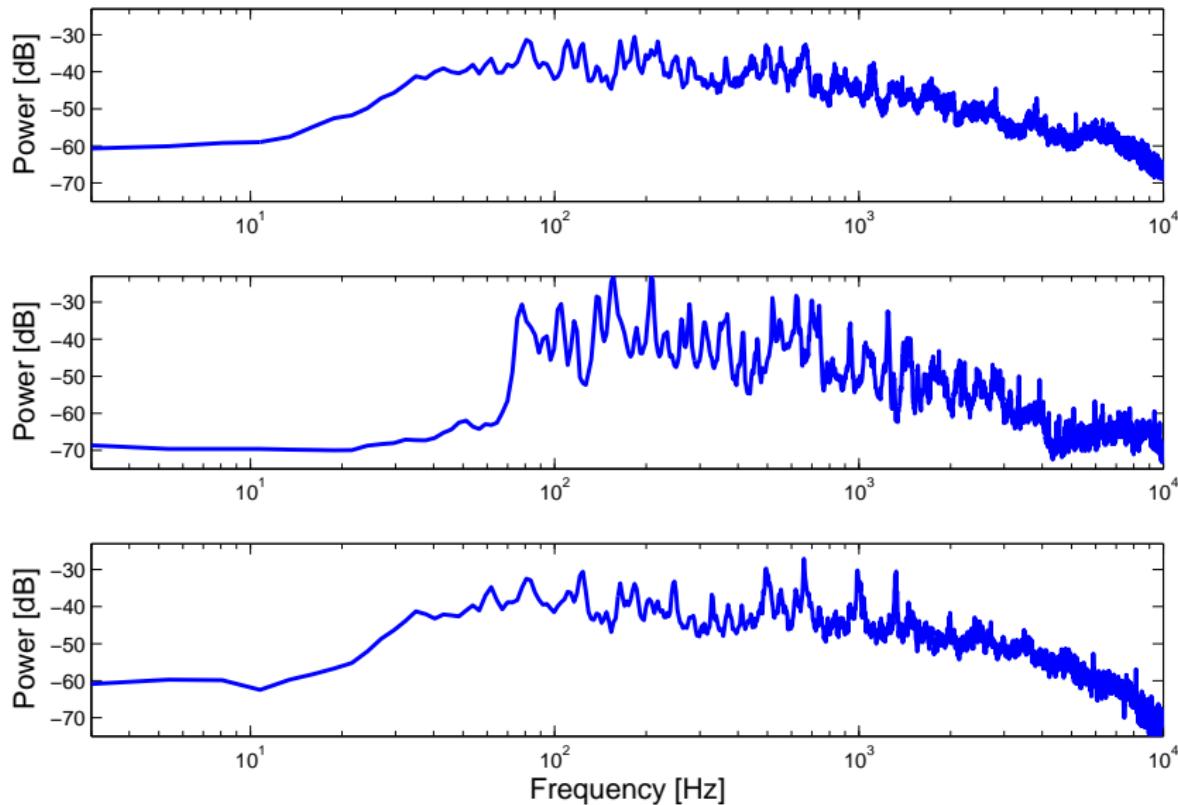

Time vs frequency

7/60

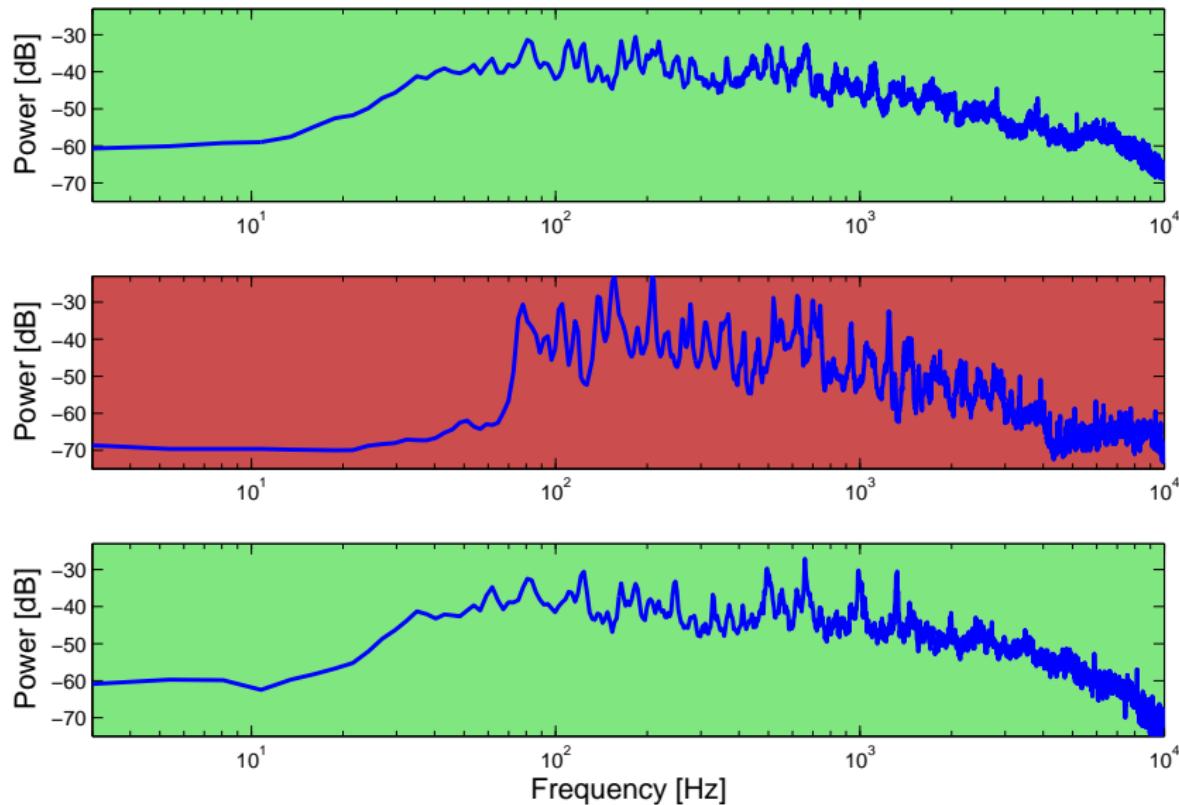

Time vs frequency

Time vs frequency

7/60

How to transform time into frequency?

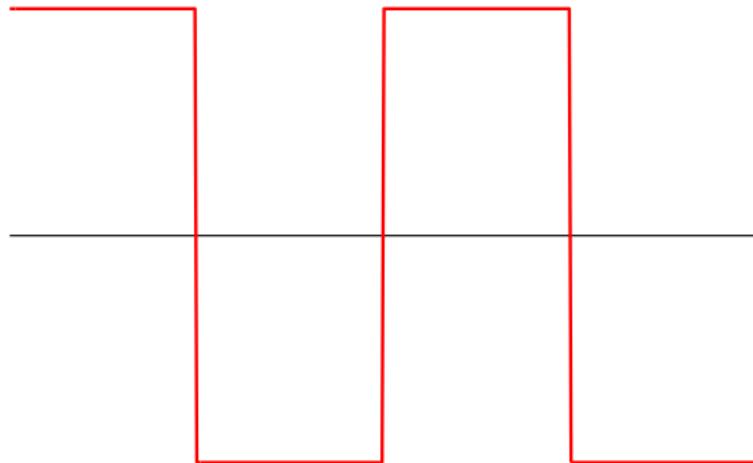

Signal analysis: Fourier series

9/60

Any signal $x(t)$ of length T can be represented as a sum of harmonics.

Joseph Fourier

Example: square wave

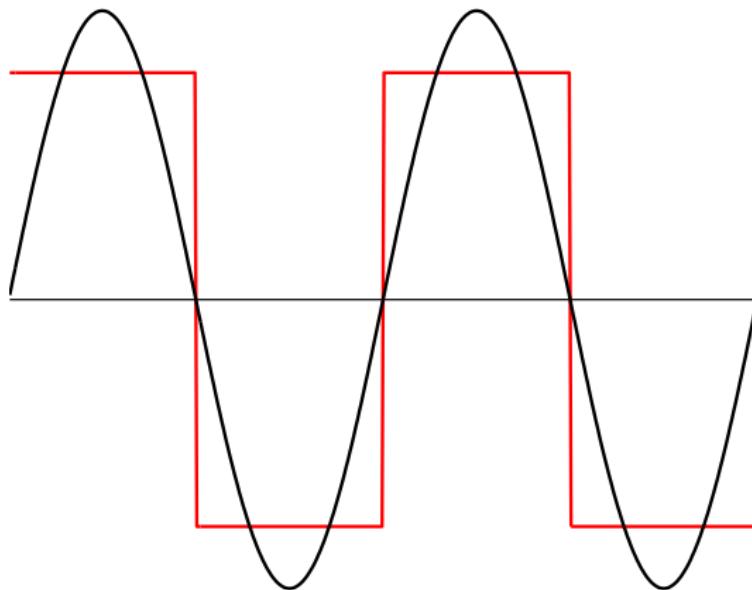

Signal analysis: Fourier series

9/60

Any signal $x(t)$ of length T can be represented as a sum of harmonics.

Joseph Fourier

Example: square wave

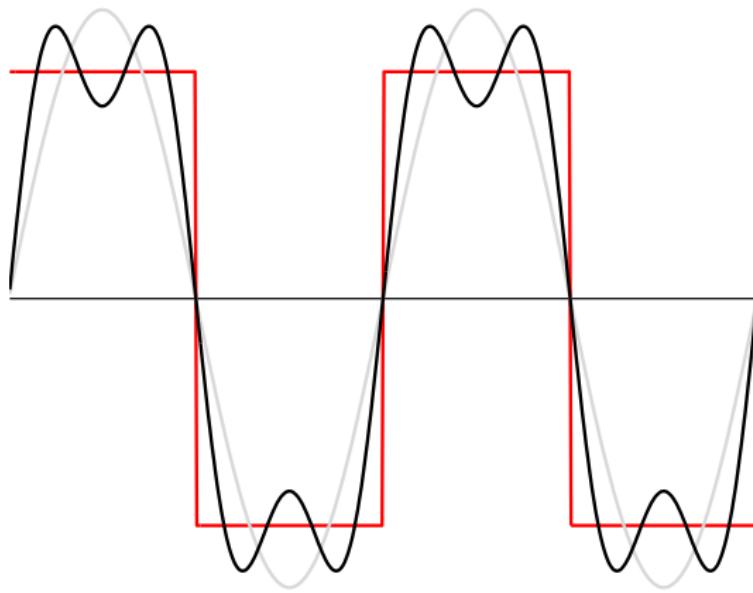

Signal analysis: Fourier series

9/60

Any signal $x(t)$ of length T can be represented as a sum of harmonics.

Joseph Fourier

Example: square wave

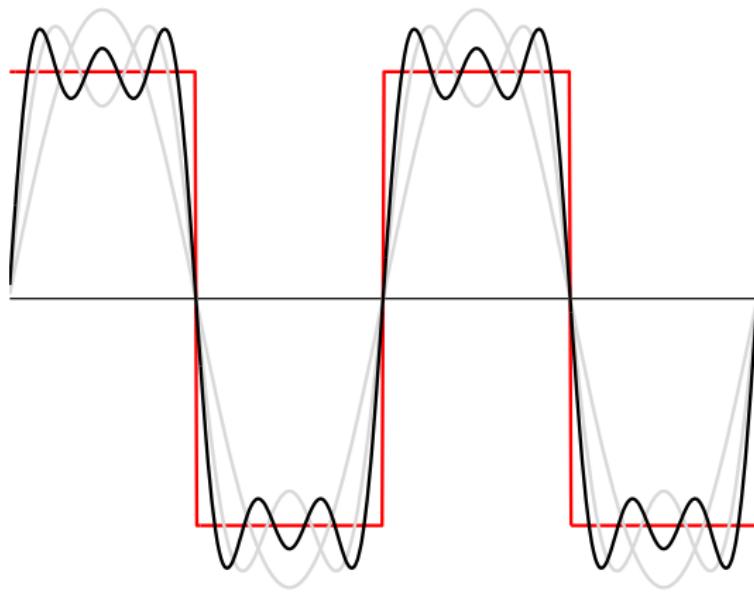

Signal analysis: Fourier series

9/60

Any signal $x(t)$ of length T can be represented as a sum of harmonics.

Joseph Fourier

Example: square wave

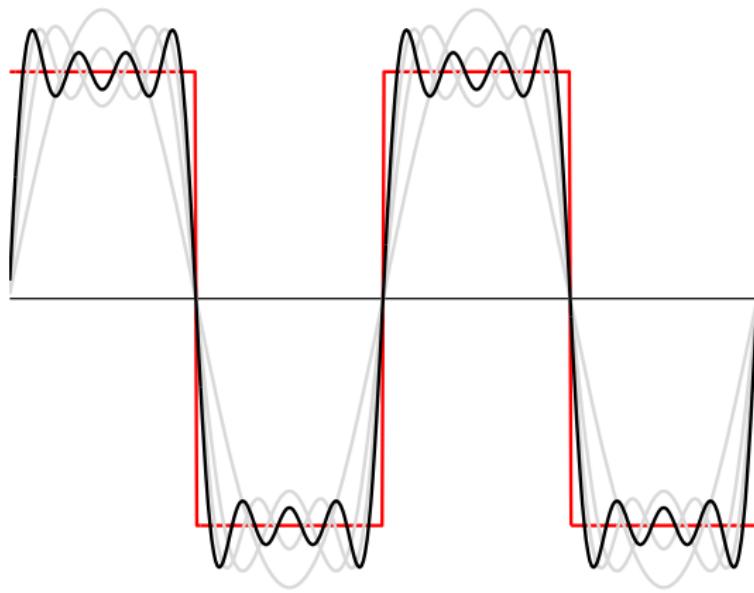

Signal analysis: Fourier series

9/60

Any signal $x(t)$ of length T can be represented as a sum of harmonics.

Joseph Fourier

Example: square wave

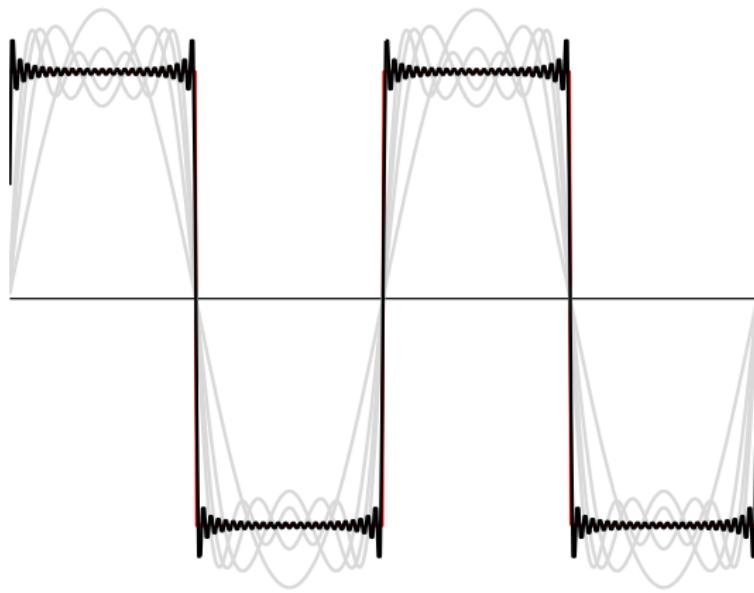

Signal analysis: Fourier series

9/60

Any signal $x(t)$ of length T can be represented as a sum of harmonics.

Joseph Fourier

Example: square wave

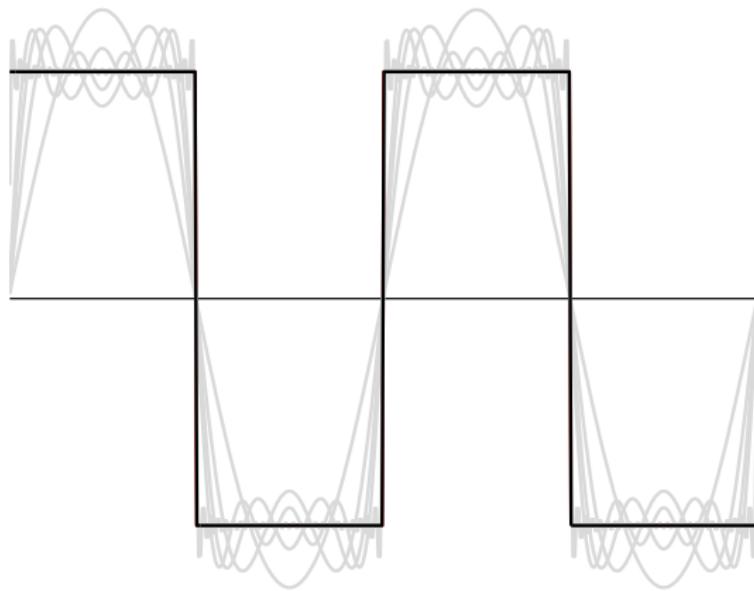

Signal analysis: Fourier series

Any signal $x(t)$ of length T can be represented as a sum of harmonics.

Joseph Fourier

Example: square wave

Signal analysis: Fourier series

Any signal $x(t)$ of length T can be represented as a sum of harmonics.

$$x(t) = \sum_{k=0}^{\infty} \left[a_k \cos \left(2\pi \frac{k}{T} t \right) + b_k \sin \left(2\pi \frac{k}{T} t \right) \right] \quad (1)$$

$$= A_0 + \sum_{k=1}^{\infty} A_k \cos \left(k \frac{2\pi}{T} t + \phi_k \right) \quad (2)$$

Signal analysis: Fourier series

10/60

Any signal $x(t)$ of length T can be represented as a sum of harmonics.

$$x(t) = \sum_{k=0}^{\infty} \left[a_k \cos \left(2\pi \frac{k}{T} t \right) + b_k \sin \left(2\pi \frac{k}{T} t \right) \right] \quad (1)$$

$$= A_0 + \sum_{k=1}^{\infty} A_k \cos \left(k \frac{2\pi}{T} t + \phi_k \right) \quad (2)$$

where

$\frac{2\pi}{T}$: Fundamental frequency (period T)

k : Harmonic number

$A_0 = a_0$: Constant signal offset

$A_k = \sqrt{a_k^2 + b_k^2}$: Amplitude of k -th harmonic

$\phi_k = -\arctan \frac{b_k}{a_k}$: Phase of k -th harmonic

Note: assumes the signal is periodic: $x(t+T) = x(t)$

Any signal $x(t)$ of length T can be represented as a sum of harmonics.

$$x(t) = \sum_{k=0}^{\infty} \left[a_k \cos\left(2\pi \frac{k}{T} t\right) + b_k \sin\left(2\pi \frac{k}{T} t\right) \right]$$

Let's try to rewrite this equation.

Using Euler's formula

$$e^{jt} = \cos(t) + j \sin(t), \quad (3)$$

we can write

$$\cos\left(2\pi \frac{k}{T} t\right) = \frac{1}{2} \left(e^{j2\pi \frac{k}{T} t} + e^{-j2\pi \frac{k}{T} t} \right) \quad (4a)$$

$$\sin\left(2\pi \frac{k}{T} t\right) = -j \frac{1}{2} \left(e^{j2\pi \frac{k}{T} t} - e^{-j2\pi \frac{k}{T} t} \right). \quad (4b)$$

Then $x(t)$ can be written as

$$\begin{aligned}x(t) &= \sum_{k=0}^{\infty} \left[\frac{1}{2} a_k \left(e^{j2\pi\frac{k}{T}t} + e^{-j2\pi\frac{k}{T}t} \right) - j \frac{1}{2} b_k \left(e^{j2\pi\frac{k}{T}t} - e^{-j2\pi\frac{k}{T}t} \right) \right] \\&= \sum_{k=0}^{\infty} \left[\frac{1}{2} (a_k - jb_k) e^{j2\pi\frac{k}{T}t} + \frac{1}{2} (a_k + jb_k) e^{-j2\pi\frac{k}{T}t} \right] \\&= a_0 + \sum_{k=1}^{\infty} \left[X(k) e^{j2\pi\frac{k}{T}t} + X(-k) e^{-j2\pi\frac{k}{T}t} \right] \\&= \sum_{k=-\infty}^{\infty} X(k) e^{j2\pi\frac{k}{T}t}\end{aligned}\tag{5}$$

where we have defined the coefficients

$$X(0) = a_0, \quad X(k) = \frac{1}{2}(a_k - jb_k), \quad X(-k) = \frac{1}{2}(a_k + jb_k).$$

Hence, the complex form of the *Fourier series* is

$$x(t) = \sum_{k=-\infty}^{\infty} X(k) e^{j2\pi \frac{k}{T} t}. \quad (6)$$

- ▶ $X(k)$ are the *complex valued* Fourier series expansion coefficients

Hence, the complex form of the *Fourier series* is

$$x(t) = \sum_{k=-\infty}^{\infty} X(k) e^{j2\pi \frac{k}{T} t}. \quad (6)$$

- ▶ $X(k)$ are the *complex valued* Fourier series expansion coefficients

How to find these Fourier coefficients?

- ▶ by using the ‘inverse’ of (6):

$$X(k) = \frac{1}{T} \int_{t_0}^{t_0+T} x(t) e^{-j2\pi \frac{k}{T} t} dt, \quad k = 0, \pm 1, \pm 2, \dots \quad (7)$$

Hence, the complex form of the *Fourier series* is

$$x(t) = \sum_{k=-\infty}^{\infty} X(k) e^{j2\pi \frac{k}{T} t}. \quad (6)$$

- ▶ $X(k)$ are the *complex valued* Fourier series expansion coefficients

How to find these Fourier coefficients?

- ▶ by using the ‘inverse’ of (6):

$$X(k) = \frac{1}{T} \int_{t_0}^{t_0+T} x(t) e^{-j2\pi \frac{k}{T} t} dt, \quad k = 0, \pm 1, \pm 2, \dots \quad (7)$$

Note: the proof for (7) is based on orthogonality of sines and cosines

$$\int_{t_0}^{t_0+T} \cos(2\pi \frac{k}{T}) \cos(2\pi \frac{\ell}{T}) dt = \begin{cases} 0 & \text{for } k \neq \ell \\ \frac{T}{2} & \text{for } k = \ell \end{cases}$$

$$\int_{t_0}^{t_0+T} \cos(2\pi \frac{k}{T}) \sin(2\pi \frac{\ell}{T}) dt = 0 \quad \text{for all } k, \ell$$

Fourier series expansion: interpretation

14/60

Theory:

$$X(k) = \frac{1}{T} \int_{t_0}^{t_0+T} x(t) e^{-j2\pi \frac{k}{T} t} dt$$

In practice (Matlab):

```
X = fft(x)/length(x);
```

How to interpret these complex coefficients $X(k)$?

Fourier series expansion: interpretation

14/60

Theory:

$$X(k) = \frac{1}{T} \int_{t_0}^{t_0+T} x(t) e^{-j2\pi \frac{k}{T} t} dt$$

In practice (Matlab):

```
X = fft(x)/length(x);
```

How to interpret these complex coefficients $X(k)$?

$$X(k) = \frac{1}{2}(a_k - jb_k), \quad X(-k) = \frac{1}{2}(a_k + jb_k), \quad X(0) = a_0.$$

Fourier series expansion: interpretation

14/60

Theory:

$$X(k) = \frac{1}{T} \int_{t_0}^{t_0+T} x(t) e^{-j2\pi \frac{k}{T} t} dt$$

In practice (Matlab):

```
X = fft(x)/length(x);
```

How to interpret these complex coefficients $X(k)$?

$$X(k) = \frac{1}{2}(a_k - jb_k), \quad X(-k) = \frac{1}{2}(a_k + jb_k), \quad X(0) = a_0.$$

- ▶ meaning of amplitude and phase:

$$|X(0)| = a_0 = A_0 \tag{8a}$$

$$|X(k)| = \frac{1}{2} \sqrt{a_k^2 + b_k^2} = \frac{1}{2} A_k \tag{8b}$$

$$\arg X(k) = -\arg X(-k) = -\arctan \frac{b_k}{a_k} = \phi_k \tag{8c}$$

Fourier series expansion: interpretation

14/60

Theory:

$$X(k) = \frac{1}{T} \int_{t_0}^{t_0+T} x(t) e^{-j2\pi \frac{k}{T} t} dt$$

In practice (Matlab):

```
X = fft(x)/length(x);
```

How to interpret these complex coefficients $X(k)$?

$$X(k) = \frac{1}{2}(a_k - jb_k), \quad X(-k) = \frac{1}{2}(a_k + jb_k), \quad X(0) = a_0.$$

► meaning of amplitude and phase:

$$|X(0)| = a_0 = A_0 \tag{8a}$$

$$|X(k)| = \frac{1}{2} \sqrt{a_k^2 + b_k^2} = \frac{1}{2} A_k \tag{8b}$$

$$\arg X(k) = -\arg X(-k) = -\arctan \frac{b_k}{a_k} = \phi_k \tag{8c}$$

► which can be directly linked to the signal $x(t)$:

$$x(t) = A_0 + \sum_{k=1}^{\infty} A_k \cos \left(k \frac{2\pi}{T} t + \phi_k \right)$$

Fourier series, energy and power

Signal energy and power

17/60

Periodic signals have finite power P

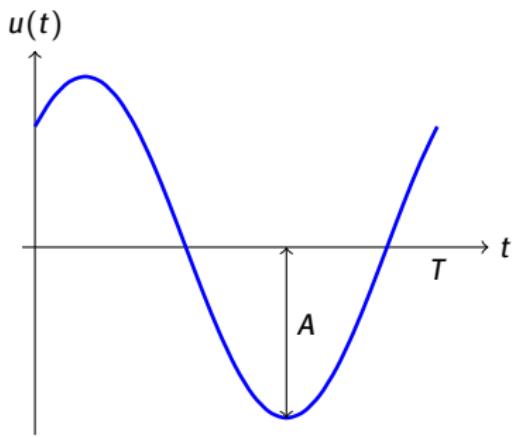

- ▶ Power = Energy per second
- ▶ Power = RMS² (Root Mean Squared)

$$\begin{aligned} P &= \frac{1}{T} \int_0^T u^2(t) dt \\ &= \frac{1}{T} \int_0^T A^2 \cos^2\left(\frac{2\pi}{T}t\right) dt \\ &= \frac{1}{T} \int_0^T \frac{1}{2}A^2 + \frac{1}{2}A^2 \cos\left(\frac{4\pi}{T}t\right) dt \\ &= \frac{1}{2}A^2 \end{aligned}$$

Periodic signals have finite power P

- ▶ Power = Energy per second
- ▶ Power = RMS² (Root Mean Squared)

$$\begin{aligned} P &= \frac{1}{T} \int_0^T u^2(t) dt \\ &= \frac{1}{T} \int_0^T A^2 \cos^2\left(\frac{2\pi}{T}t\right) dt \\ &= \frac{1}{T} \int_0^T \frac{1}{2}A^2 + \frac{1}{2}A^2 \cos\left(\frac{4\pi}{T}t\right) dt \\ &= \frac{1}{2}A^2 \end{aligned}$$

Can we calculate this also from the frequency spectrum $X(k)$?

Total power in a signal $u(t)$:

$$\begin{aligned} P &= \frac{1}{T} \int_0^T u^2(t) dt \\ &= \frac{1}{T} \int_0^T u(t) \left[\sum_{k=-\infty}^{\infty} U(k) e^{j2\pi \frac{k}{T} t} \right] dt \\ &= \sum_{k=-\infty}^{\infty} U(k) \frac{1}{T} \int_0^T u(t) e^{j2\pi \frac{k}{T} t} dt \\ &= \sum_{k=-\infty}^{\infty} U(k) U(-k) = \sum_{k=-\infty}^{\infty} U(k) U^*(k) \end{aligned} \tag{9}$$

Known as *Parseval's theorem*:

- ▶ Power in time domain = power in frequency domain

Power per frequency = power spectral *density* (PSD)

$$\begin{aligned} S_{uu}(k) &= U(k)U^*(k) \\ &= \frac{1}{2}(a_k - jb_k) \cdot \frac{1}{2}(a_k + jb_k) = \frac{1}{4} (a_k^2 + b_k^2) \end{aligned} \tag{10}$$

Or expressed in actual frequencies $f = \frac{k}{T}$:

$$S_{uu}(f) = U(f)U^*(f) \tag{11}$$

Power per frequency = power spectral *density* (PSD)

$$\begin{aligned} S_{uu}(k) &= U(k)U^*(k) \\ &= \frac{1}{2}(a_k - jb_k) \cdot \frac{1}{2}(a_k + jb_k) = \frac{1}{4} (a_k^2 + b_k^2) \end{aligned} \tag{10}$$

Or expressed in actual frequencies $f = \frac{k}{T}$:

$$S_{uu}(f) = U(f)U^*(f) \tag{11}$$

- ▶ PSD in Matlab (be aware of scaling!):
`pwelch.m`, `periodogram.m`
- ▶ PSD has no phase information

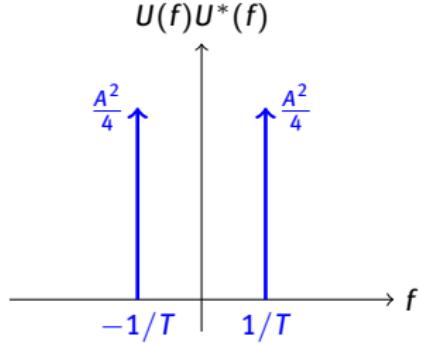

Power per frequency = power spectral *density* (PSD)

$$\begin{aligned} S_{uu}(k) &= U(k)U^*(k) \\ &= \frac{1}{2}(a_k - jb_k) \cdot \frac{1}{2}(a_k + jb_k) = \frac{1}{4} (a_k^2 + b_k^2) \end{aligned} \tag{10}$$

Or expressed in actual frequencies $f = \frac{k}{T}$:

$$S_{uu}(f) = U(f)U^*(f) \tag{11}$$

- ▶ PSD in Matlab (be aware of scaling!):
`pwelch.m`, `periodogram.m`
- ▶ PSD has no phase information

Power per frequency = power spectral *density* (PSD)

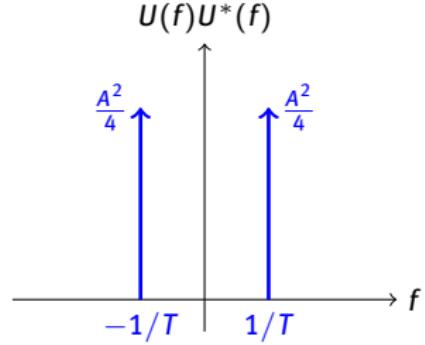

$$\begin{aligned} S_{uu}(k) &= U(k)U^*(k) \\ &= \frac{1}{2}(a_k - jb_k) \cdot \frac{1}{2}(a_k + jb_k) = \frac{1}{4} (a_k^2 + b_k^2) \end{aligned} \tag{10}$$

Or expressed in actual frequencies $f = \frac{k}{T}$:

$$S_{uu}(f) = U(f)U^*(f) \tag{11}$$

- ▶ PSD in Matlab (be aware of scaling!):
`pwelch.m`, `periodogram.m`
- ▶ PSD has no phase information
- ▶ Total power = sum of PSD over all f :

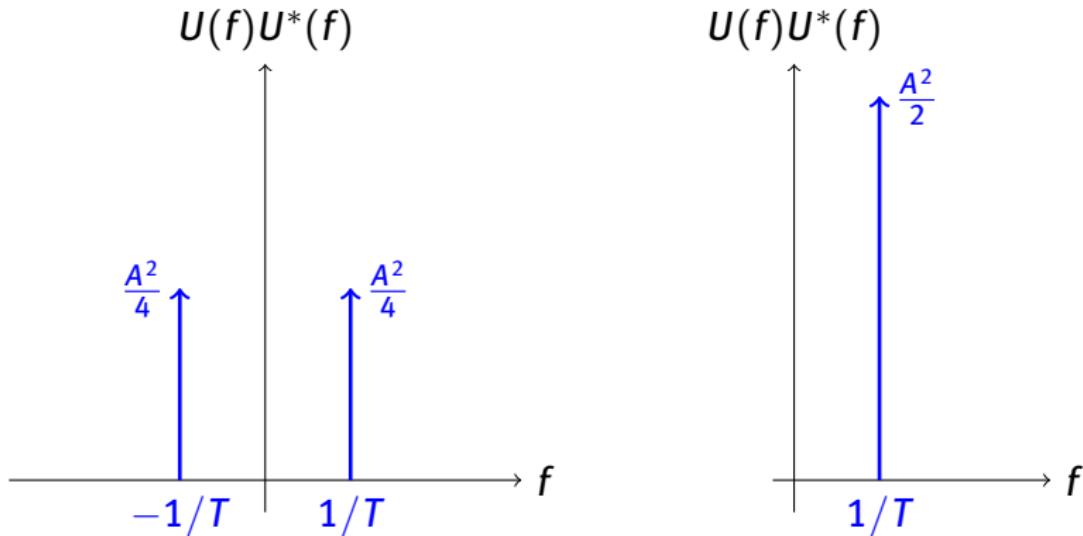

$$P = \sum U(f)U^*(f) = \frac{A^2}{4} + \frac{A^2}{4} = \frac{1}{2}A^2$$

Positive and negative frequencies

20/60

Spectral densities can be either *twosided* or *onesided*:

- ▶ Negative frequencies are added to positive frequencies
- ▶ Known as *Auto Power Spectral Density*

Common power between signals

21/60

So the product of the Fourier series $U(f)$ and $U^*(f)$ of a single signal $u(t)$ returns the energy within a single signal per frequency.

$$S_{uu}(f) = U(f)U^*(f)$$

Common power between signals

21/60

So the product of the Fourier series $U(f)$ and $U^*(f)$ of a single signal $u(t)$ returns the energy within a single signal per frequency.

$$S_{uu}(f) = U(f)U^*(f)$$

Then the product of the Fourier series of different signals $u(t)$ and $v(t)$ returns their *common* power per frequency.

$$S_{uv}(f) = U(f)V^*(f)$$

- ▶ Known as *Cross Power Spectral Density (CPSD)*
- ▶ can indicate ‘common power’ between the signals
- ▶ signals could be related if this common power repeats

Cross Power Spectral Density (CPSD):

$$S_{uv}(f) = U(f)V^*(f)$$

Interpretation:

- ▶ For each frequency: how much power of u is present in v ?
- ▶ Can indicate (cross-)covariance between u and v

Cross Power Spectral Density (CPSD):

$$S_{uv}(f) = U(f)V^*(f)$$

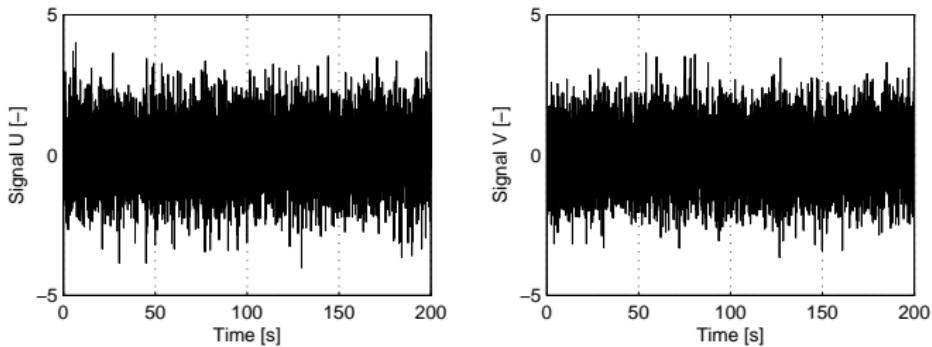

Interpretation:

- ▶ For each frequency: how much power of u is present in v ?
- ▶ Can indicate (cross-)covariance between u and v

Remarks:

- ▶ $S_{uv}(f)$ does contain phase information
 - Indicates how much v is shifted w.r.t. u for each frequency f
- ▶ $S_{vu}(f) = S_{uv}^*(f)$
 - same magnitude, negative phase
- ▶ If $u = v$, then Cross PSD reduces to Auto PSD
- ▶ Matlab: `cpsd.m` (again, be aware of scaling!)

Cross power: example

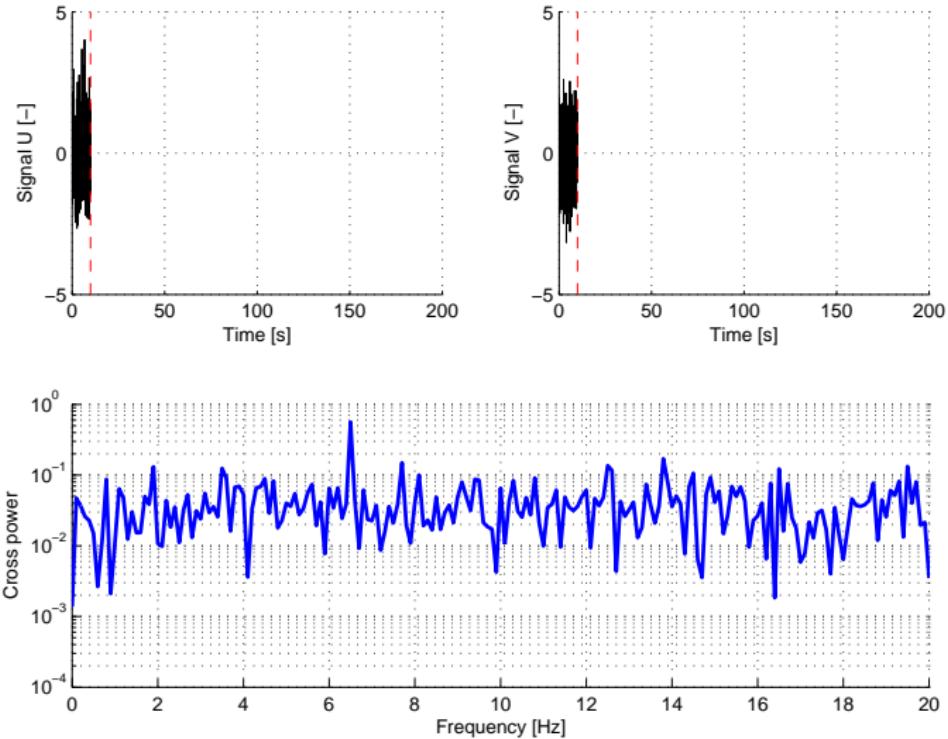

Assume two (apparently) noisy signals $u(t)$ and $v(t)$.

- ▶ Do these signals have common ground?
- ▶ I.e. is there a repeated common frequency in both?
- ▶ Compute CPSD of several pieces (frames) of the signals, and average them

Cross power and importance of averaging

Frames of 10s.

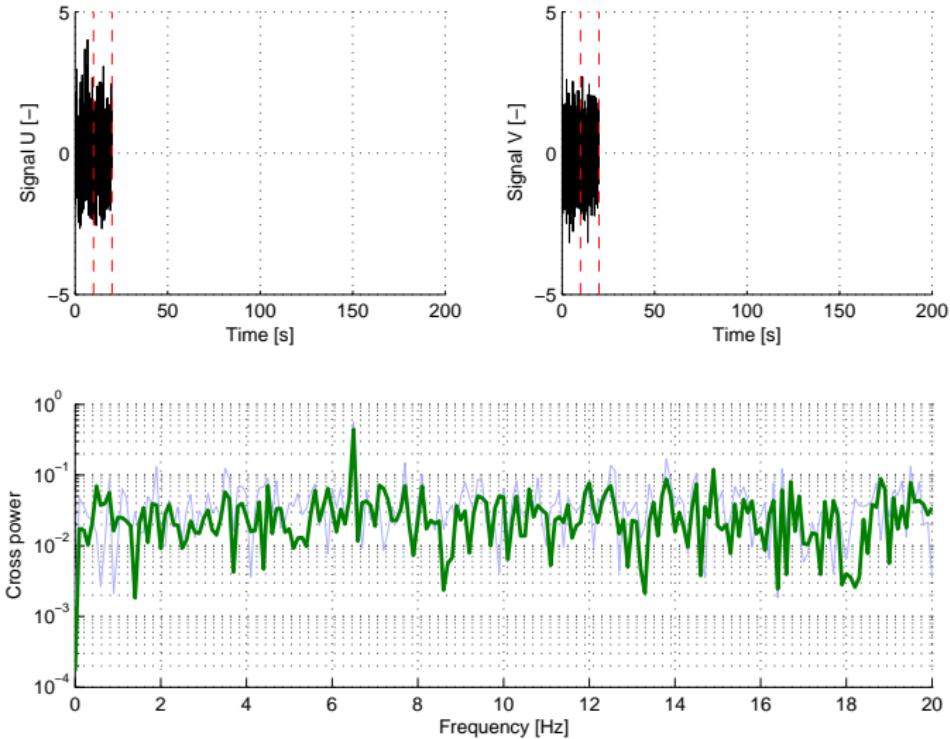

- ▶ 1 frame
- ▶ 2 frames
- ▶ 4 frames
- ▶ 10 frames
- ▶ 400 frames

Cross power and importance of averaging

Frames of 10s.

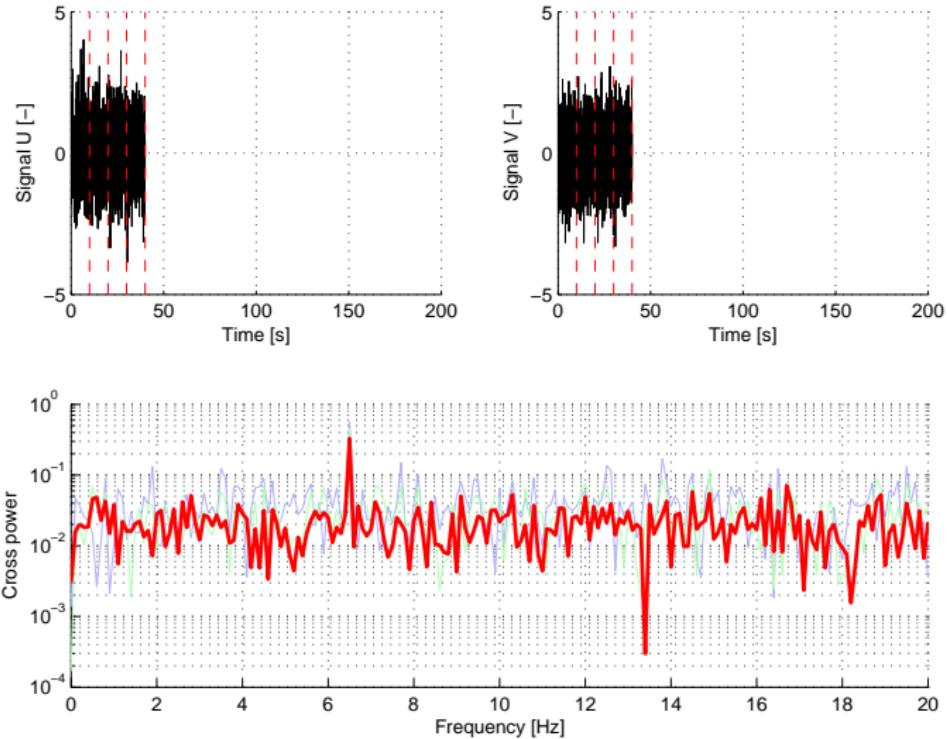

- ▶ 1 frame
- ▶ 2 frames
- ▶ 4 frames
- ▶ 10 frames
- ▶ 400 frames

Cross power and importance of averaging

Frames of 10s.

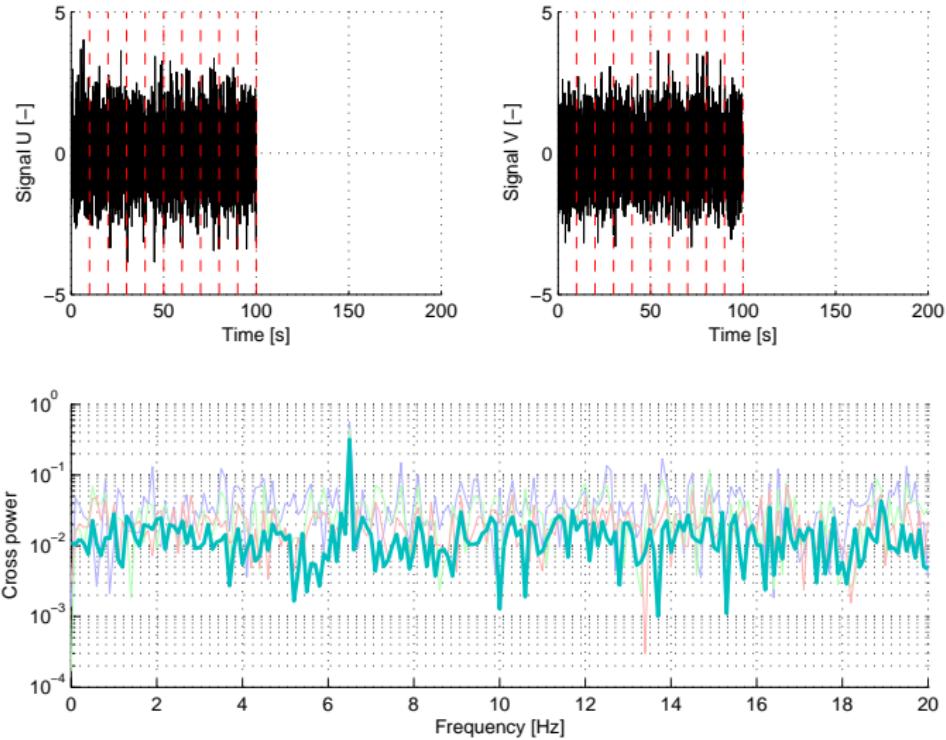

- ▶ 1 frame
- ▶ 2 frames
- ▶ 4 frames
- ▶ 10 frames
- ▶ 400 frames

Cross power and importance of averaging

Frames of 10s.

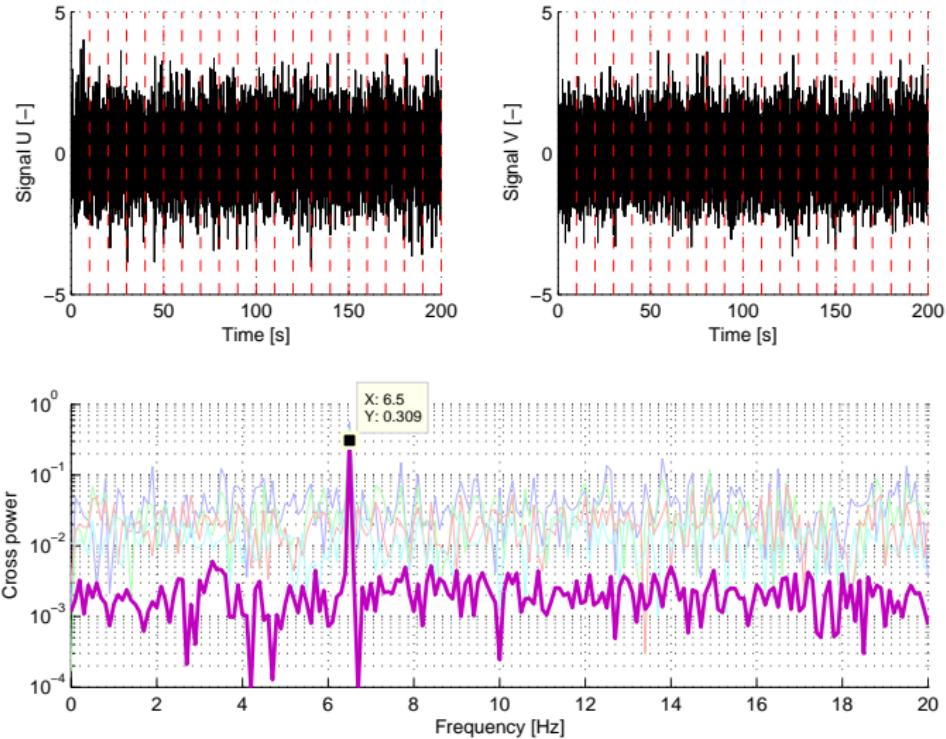

- ▶ 1 frame
- ▶ 2 frames
- ▶ 4 frames
- ▶ 10 frames
- ▶ 400 frames

Cross power and importance of averaging

Frames of 10s.

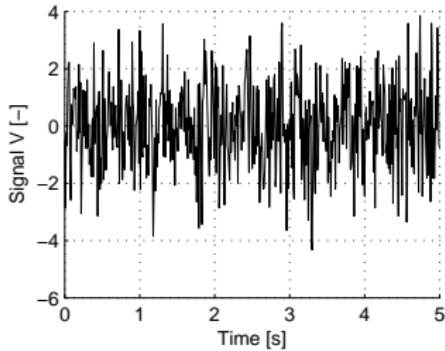

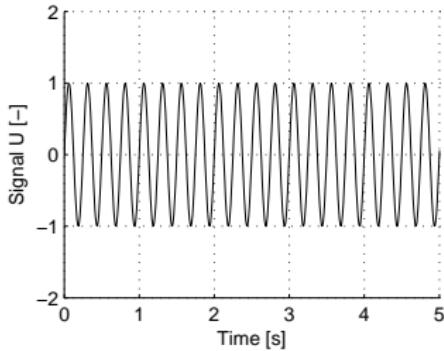

- ▶ 1 frame
- ▶ 2 frames
- ▶ 4 frames
- ▶ 10 frames
- ▶ 400 frames

Hence, averaging in computing a CPSD is important to

- ▶ emphasize repeating commonness between two signals
- ▶ but also to minimize the effect of randomness or noise

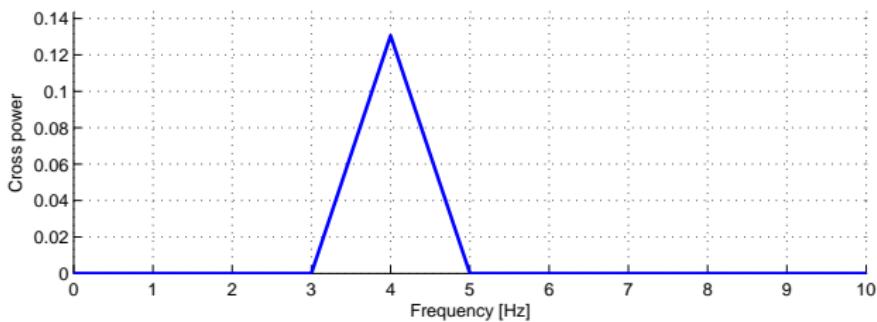

Example:

- ▶ $u(t)$ is a 4 Hz sine wave
- ▶ $v(t)$ is a random number sequence

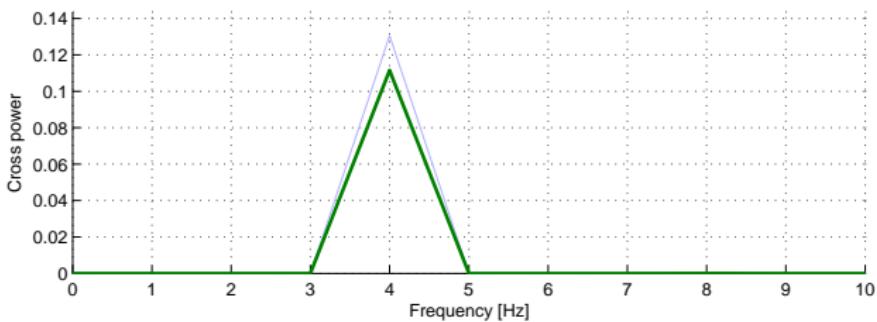

Frames of 1s.

- ▶ 1 frame
- ▶ 3 frames
- ▶ 10 frames
- ▶ 100 frames
- ▶ 1000 frames

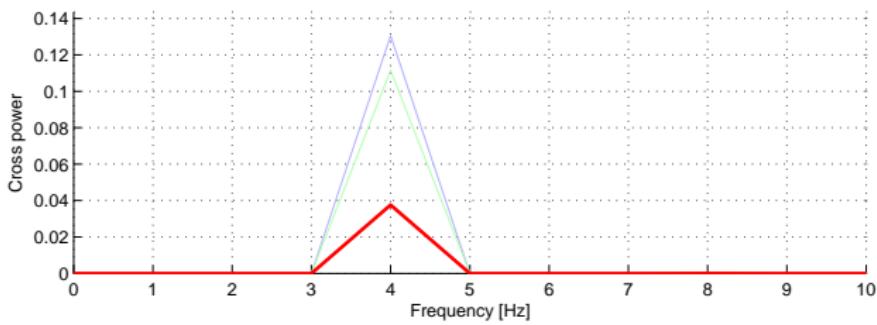

Frames of 1s.

- ▶ 1 frame
- ▶ 3 frames
- ▶ 10 frames
- ▶ 100 frames
- ▶ 1000 frames

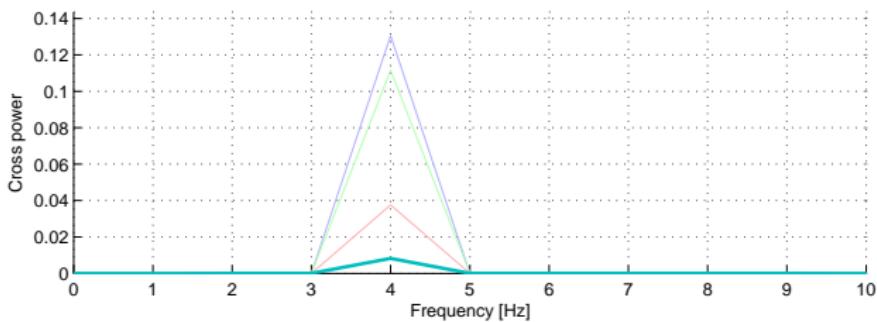

Frames of 1s.

- ▶ 1 frame
- ▶ 3 frames
- ▶ 10 frames
- ▶ 100 frames
- ▶ 1000 frames

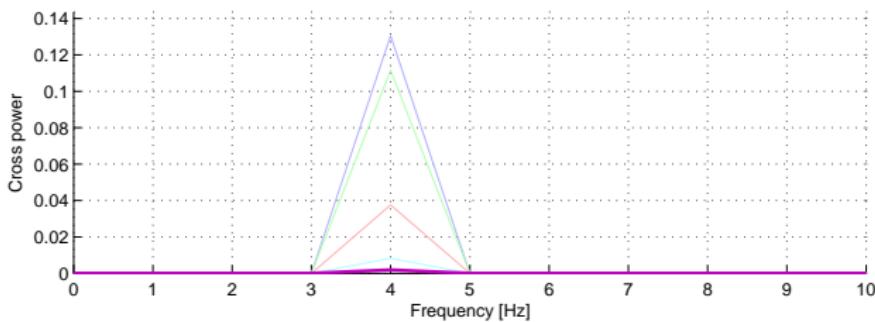

Frames of 1s.

- ▶ 1 frame
- ▶ 3 frames
- ▶ 10 frames
- ▶ 100 frames
- ▶ 1000 frames

Frames of 1s.

- ▶ 1 frame
- ▶ 3 frames
- ▶ 10 frames
- ▶ 100 frames
- ▶ 1000 frames

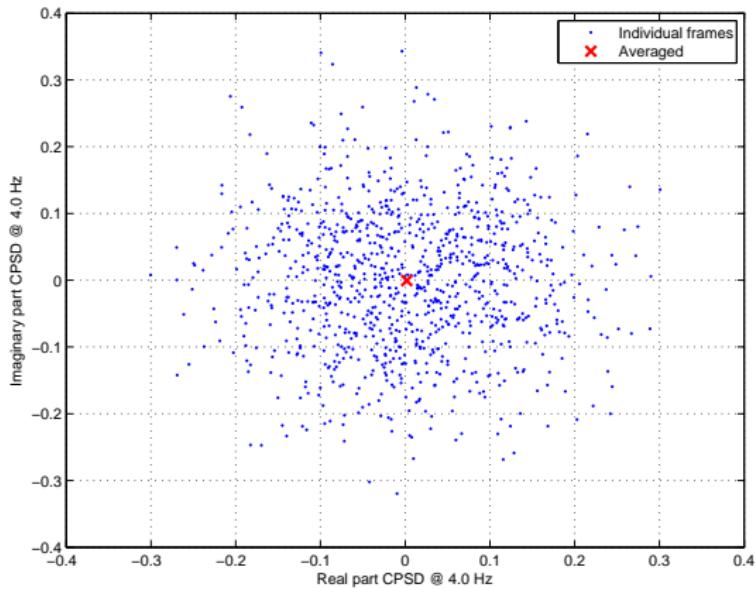

Note that $U(f)V^*(f)$ with $U(f) \neq V(f)$ is a complex number.
Hence, it has phase!

- ▶ We're averaging vectors with random size and random angles
- ▶ Hence, average CPSD with a random number converges to zero

Averaging a complex number

27/60

Conclusion:

- ▶ always calculate average CPSD: $\frac{1}{N} \sum_{i=1}^N S_{uv}^i(f) = \frac{1}{N} \sum_{i=1}^N U_i(f)V_i^*(f)$

Averaging the Auto PSD

Note that averaging the *auto* PSD for noisy signals is also a good idea

- ▶ AP PSD is a non-negative real-valued function $S_{uu}(f) \in \mathbb{R}_{\geq 0}$
- ▶ Hence, phase is constant at 0°
- ▶ Averaged AP PSD $A_u(f)$ will thus not converge to zero

Due to Parseval we know that

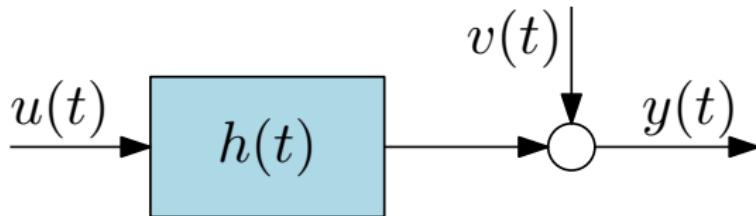

$$\sum_f A_u(f) = \sum_f \left(\frac{1}{N} \sum_{i=1}^N S_{uu}^i(f) \right) = P > 0.$$

For zero-mean white noise the AP PSD converges to flat spectrum, hence

$$\lim_{N \rightarrow \infty} A_u(f) = A_u = \frac{\sigma^2}{N_f},$$

where σ^2 is the variance of the white noise signal $u(t)$, and N_f is the number of frequency points in the AP PSD.

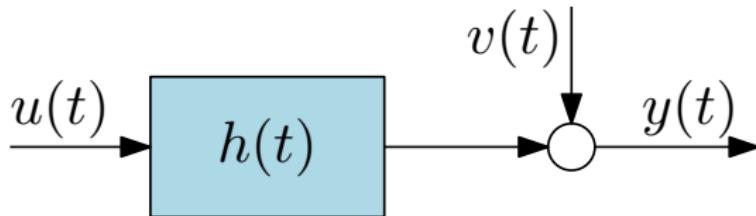

How do we use this to
‘measure’ a system?

- ▶ impulse response $h(t)$ is unknown (but approximately linear)
- ▶ $v(t)$ is (unknown) disturbance or noise

Direct method:

- ▶ no controller present: open-loop
- ▶ directly measuring plant input u and plant output y

- ▶ impulse response $h(t)$ is unknown (but approximately linear)
- ▶ $v(t)$ is (unknown) disturbance or noise

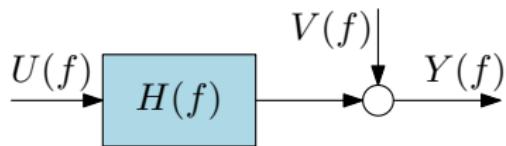

Direct method:

- ▶ no controller present: open-loop
- ▶ directly measuring plant input u and plant output y

$$y(t) = h(t) \otimes u(t) + v(t)$$

But how to obtain an estimate for $H(s) = \mathcal{L}\{h(t)\}$?

Direct open loop method

First convert all signals to frequency domain:

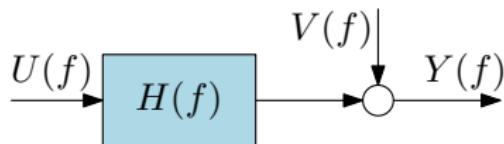

$$u(t) \xrightarrow{\text{fft}} U(f)$$

$$y(t) \xrightarrow{\text{fft}} Y(f)$$

$$v(t) \xrightarrow{\text{fft}} V(f)$$

(Note that $v(t)$ and $V(f)$ are actually unknown).

Direct open loop method

First convert all signals to frequency domain:

$$u(t) \xrightarrow{\text{fft}} U(f)$$

$$y(t) \xrightarrow{\text{fft}} Y(f)$$

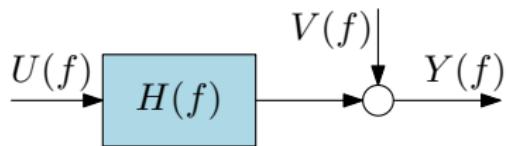

$$v(t) \xrightarrow{\text{fft}} V(f)$$

(Note that $v(t)$ and $V(f)$ are actually unknown).

Then, due to superposition:

$$Y(f) = H(f)U(f) + V(f)$$

Direct open loop method

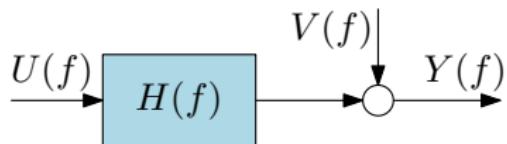

$$Y(f) = H(f)U(f) + V(f)$$

$$Y(f)U^*(f) = H(f)U(f)U^*(f) + V(f)U^*(f)$$

$$S_{yu}(f) = H(f)S_{uu}(f) + \underbrace{S_{vu}(f)}_{???$$

Direct open loop method

$$Y(f) = H(f)U(f) + V(f)$$

$$Y(f)U^*(f) = H(f)U(f)U^*(f) + V(f)U^*(f)$$

$$S_{yu}(f) = H(f)S_{uu}(f) + \underbrace{S_{vu}(f)}_{???$$

If we can make sure that $S_{vu}(f) \approx 0$, then

$$H(f) \approx \frac{S_{yu}(f)}{S_{uu}(f)}$$

How to minimize the effect of $v(t)$?

- ▶ By making sure $u(t)$ and $v(t)$ are uncorrelated
 - e.g. by choosing $u(t)$ white noise, or other random signal
- ▶ By taking multiple data series N and *averaging* them

How to minimize the effect of $v(t)$?

- ▶ By making sure $u(t)$ and $v(t)$ are uncorrelated
 - e.g. by choosing $u(t)$ white noise, or other random signal
- ▶ By taking multiple data series N and *averaging* them

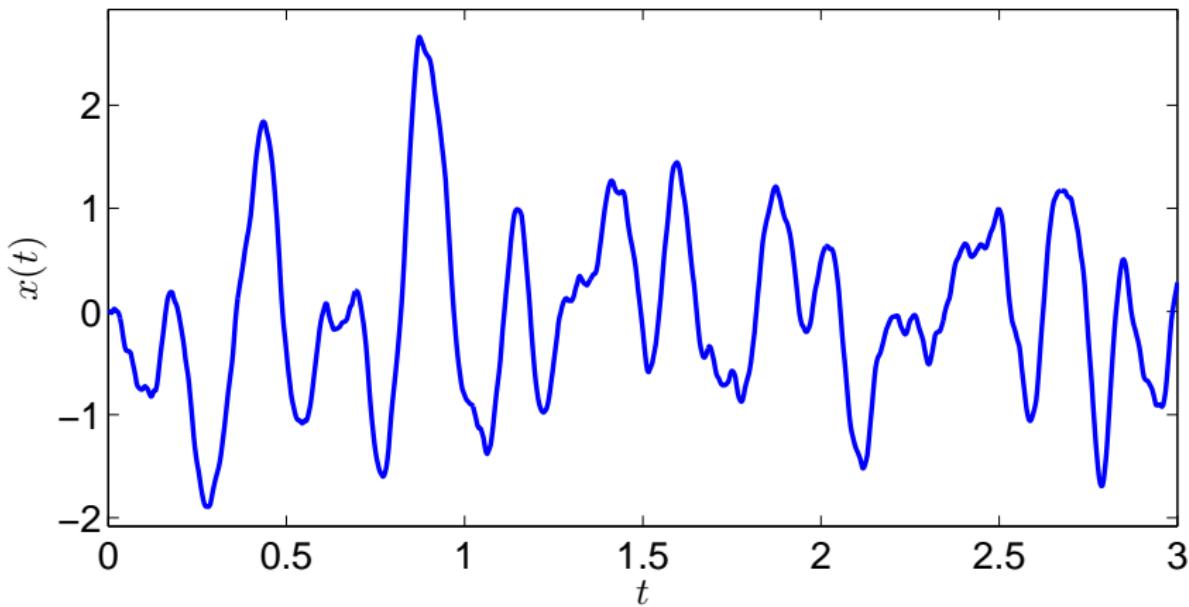

Then $\lim_{N \rightarrow \infty} \frac{1}{N} \sum_{i=1}^N S_{uv}^i(f) = 0$, so that

$$H(f) \approx \frac{\sum_{i=1}^N S_{yu}^i(f)}{\sum_{i=1}^N S_{uu}^i(f)} = \frac{\sum_{i=1}^N Y_i(f) U_i^*(f)}{\sum_{i=1}^N U_i(f) U_i^*(f)} \quad (12)$$

Of course, averaging measurements allows you to

- ▶ minimize the effect of disturbances, measurement noise, etc.
- ▶ reduce the uncertainty on your end result (scales with \sqrt{N})

Welch's averaged modified periodogram method

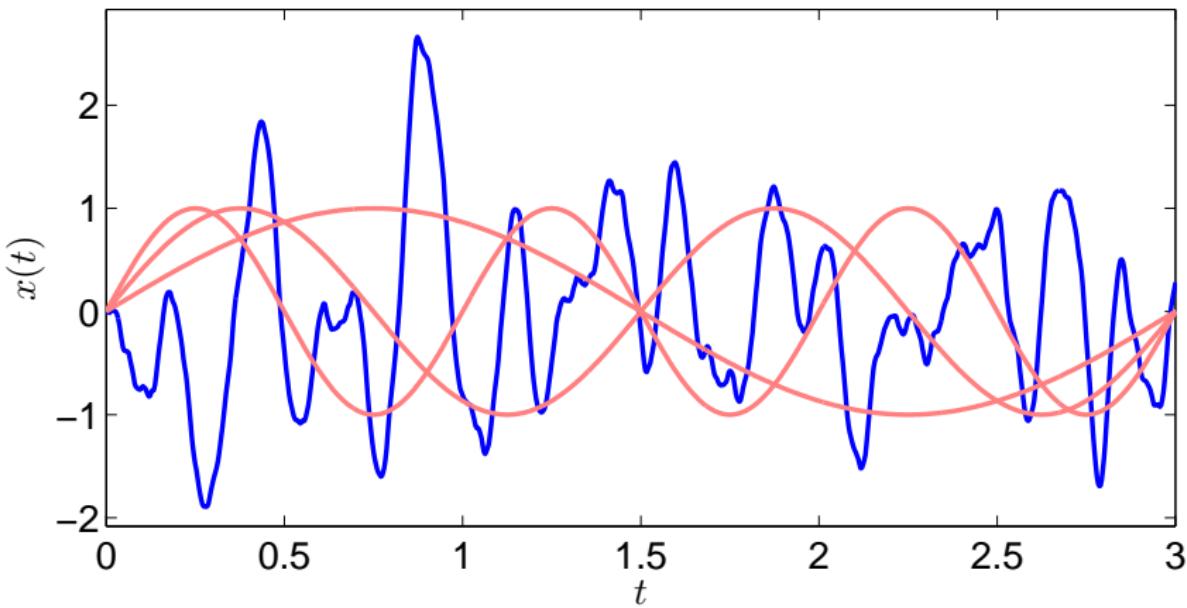

- ▶ Example: one data serie of 3 seconds (for both input and output)

Transfer function estimates using Welch

34/60

Welch's averaged modified periodogram method

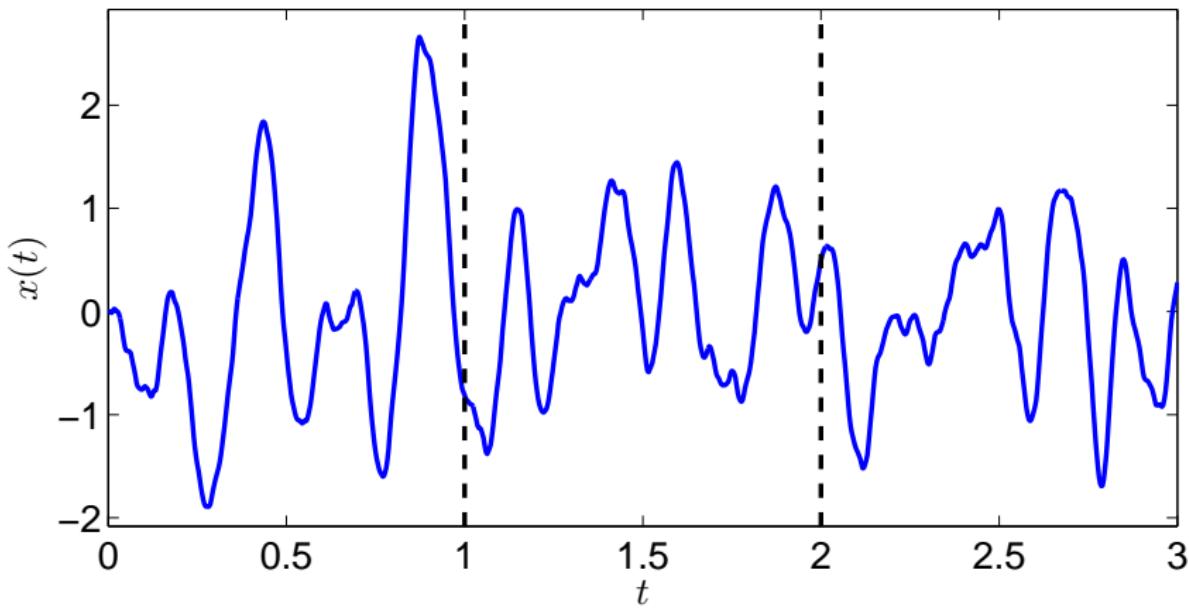

- ▶ Calculated spectrum: $\frac{1}{3}\text{Hz}$, $\frac{2}{3}\text{Hz}$, 1Hz , ...
- ▶ Frequency resolution: $\frac{1}{3}\text{Hz}$

Transfer function estimates using Welch

34/60

Welch's averaged modified periodogram method

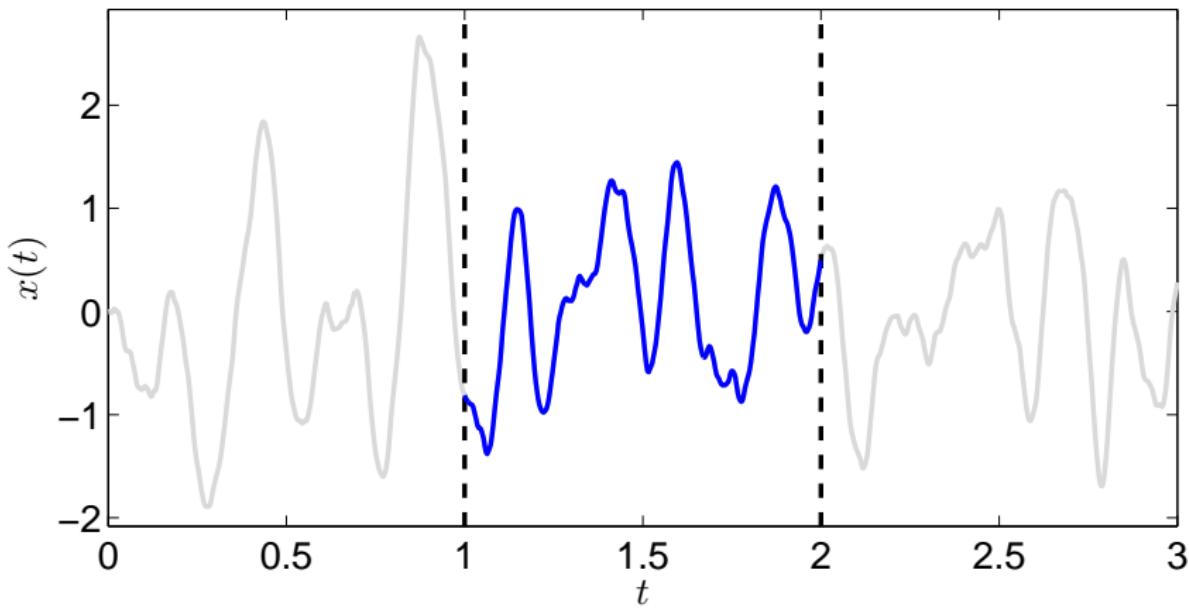

- ▶ Create three data frames by cutting the original one

Transfer function estimates using Welch

34/60

Welch's averaged modified periodogram method

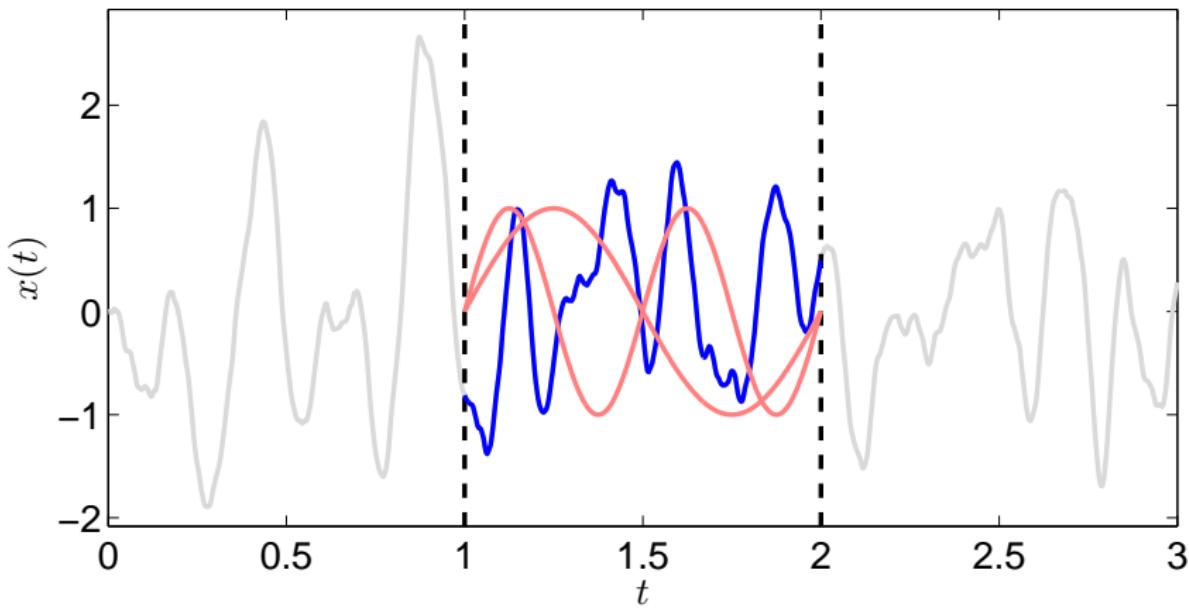

- ▶ Calculate Fourier series (and APSD and CPSD) for each block...

Transfer function estimates using Welch

34/60

Welch's averaged modified periodogram method

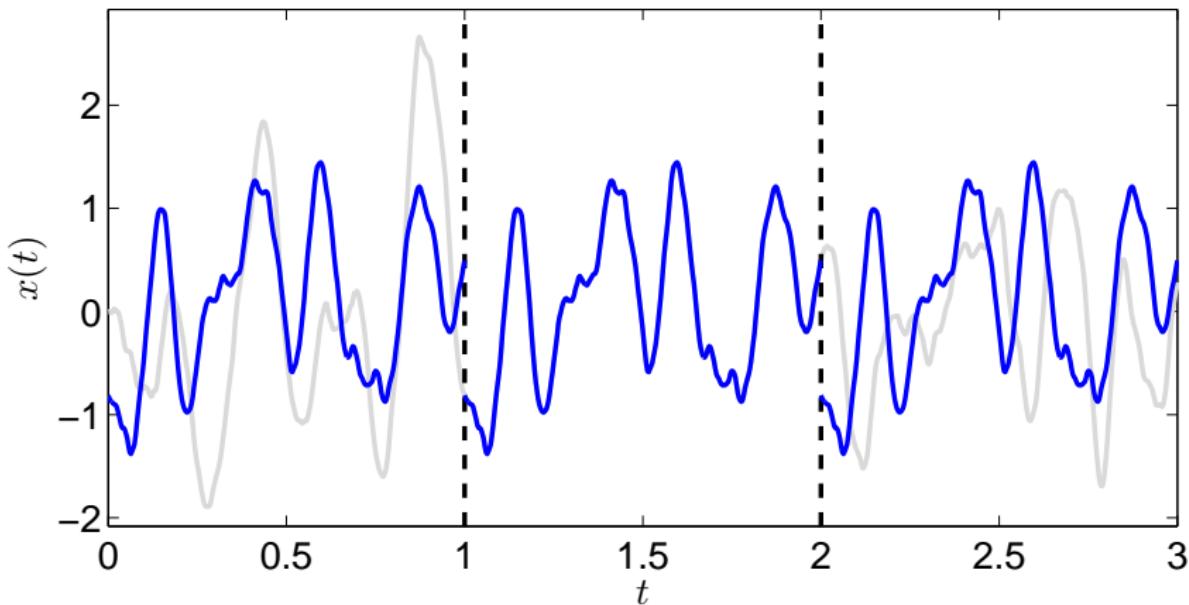

- ▶ Calculated spectrum: 1Hz, 2Hz, 3Hz, ...
- ▶ Frequency resolution: 1Hz \Rightarrow *loss of resolution*

Transfer function estimates using Welch

34/60

Welch's averaged modified periodogram method

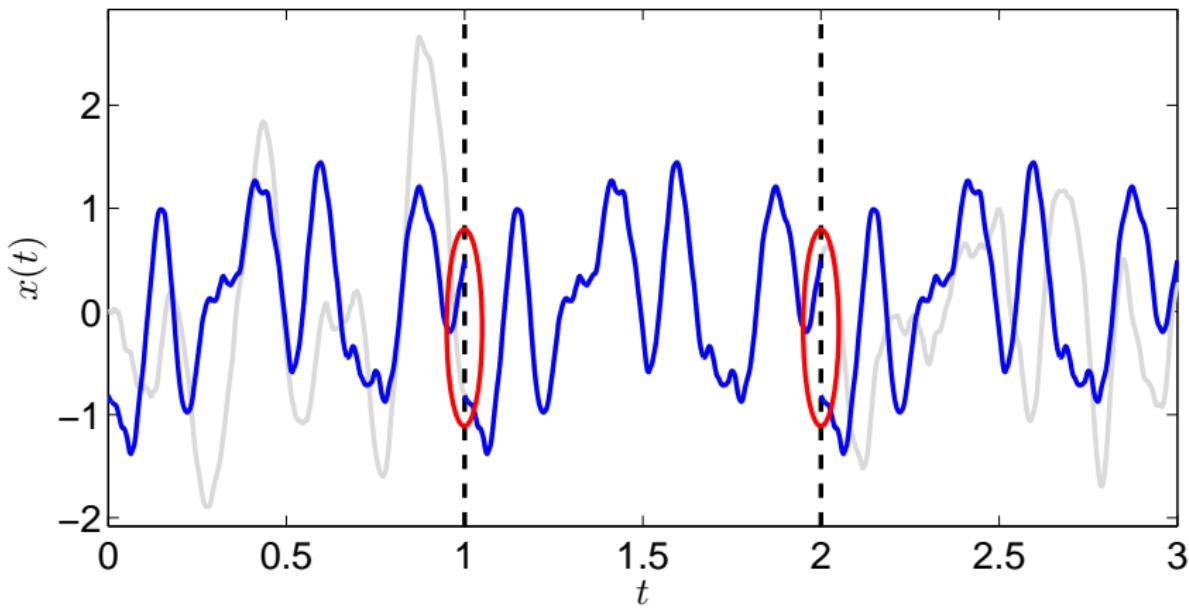

- ▶ Fourier assumes the data is periodic...

Transfer function estimates using Welch

34/60

Welch's averaged modified periodogram method

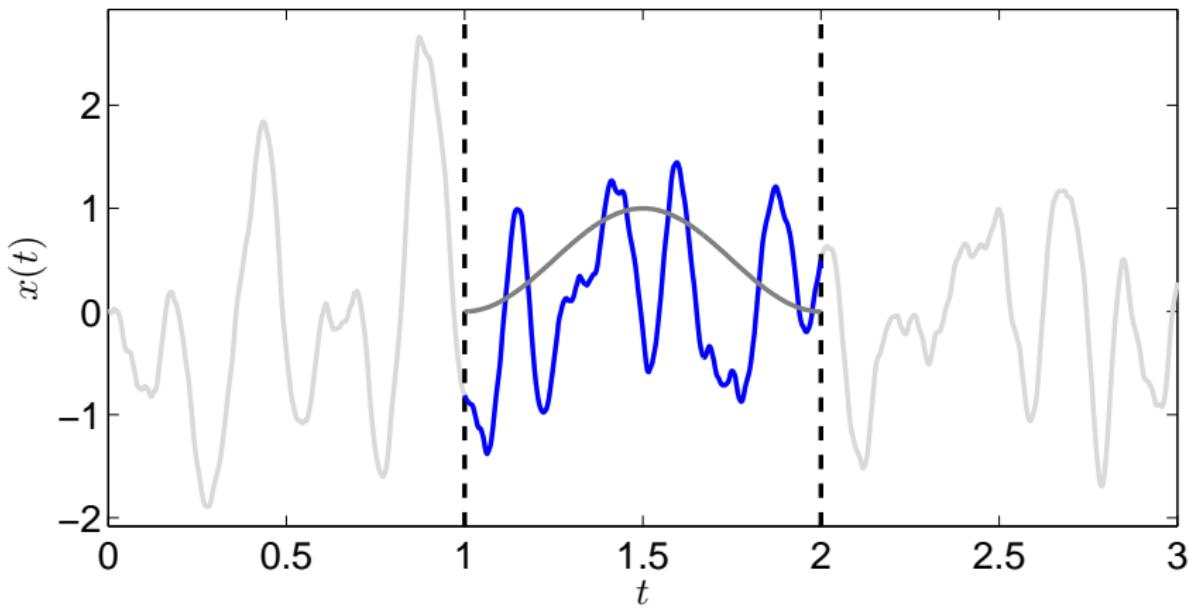

- ▶ ... which introduces non-present frequencies

Transfer function estimates using Welch

34/60

Welch's averaged modified periodogram method

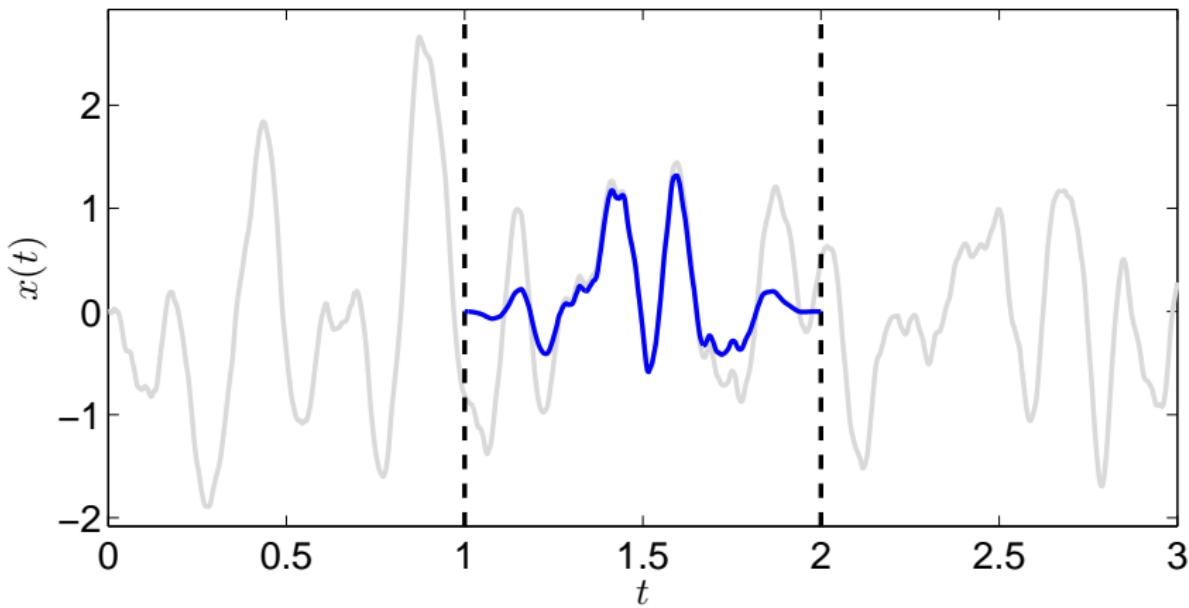

- ▶ Solution: multiply signal with a *window*

Transfer function estimates using Welch

34/60

Welch's averaged modified periodogram method

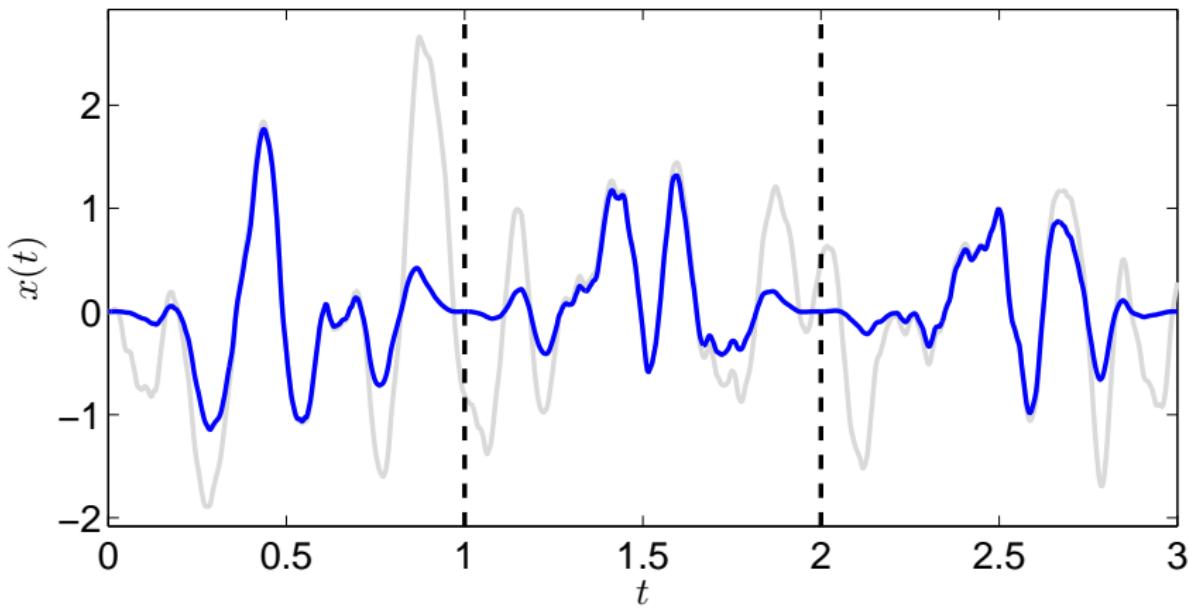

- ▶ Solution: multiply signal with a *window*

Transfer function estimates using Welch

34/60

Welch's averaged modified periodogram method

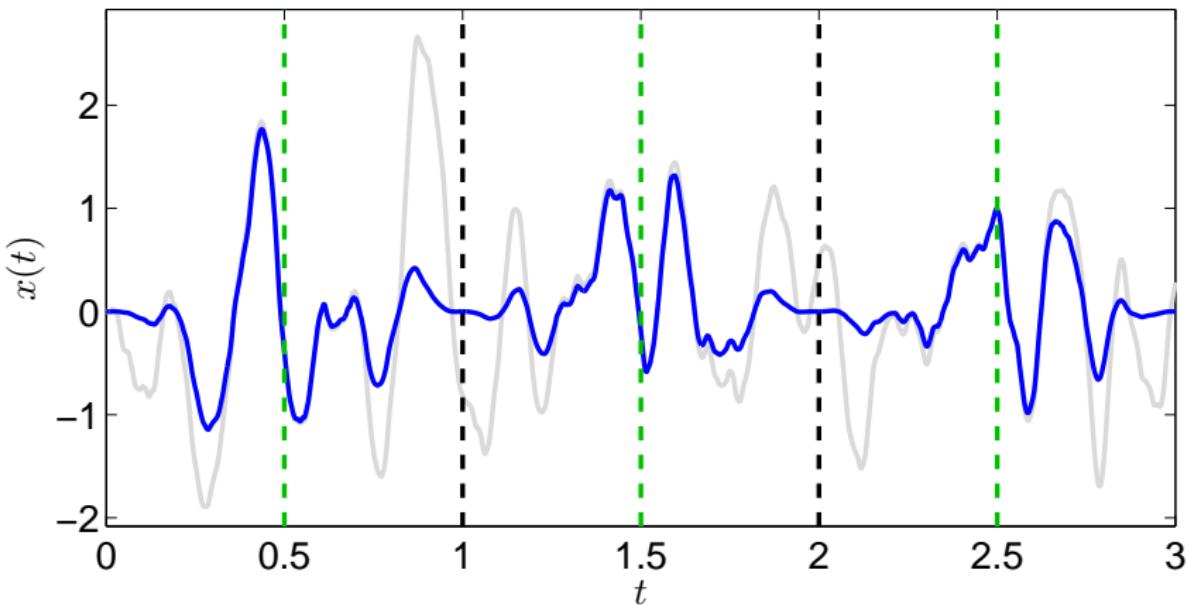

- Disadvantage: loss of data at frame boundaries

Transfer function estimates using Welch

34/60

Welch's averaged modified periodogram method

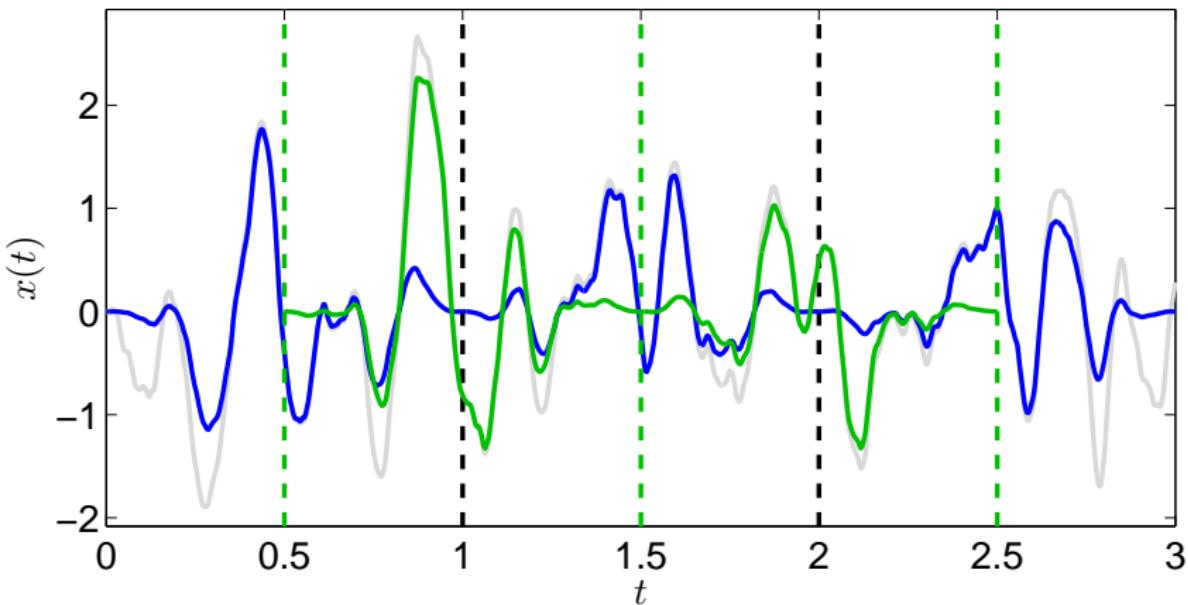

- ▶ Solution: create more frames by *overlapping*

Transfer function estimates using Welch

34/60

Welch's averaged modified periodogram method

- Now: averaging over 5 frames, resolution of 1Hz

Estimating the transfer function

Transfer function estimation:

$$H(f) \approx \frac{\sum_{i=1}^N S_{yu}^i(f)}{\sum_{i=1}^N S_{uu}^i(f)} = \frac{\sum_{i=1}^N \bar{Y}_i(f) \bar{U}_i^*(f)}{\sum_{i=1}^N \bar{U}_i(f) \bar{U}_i^*(f)}, \quad (13)$$

where \bar{U} and \bar{Y} indicate windowed Fourier coefficients of u and y .

In Matlab:

```
[H, hz] = tfestimate(u, y, window, noverlap, nfft, fs)
```

Transfer function estimation:

$$H(f) \approx \frac{\sum_{i=1}^N S_{yu}^i(f)}{\sum_{i=1}^N S_{uu}^i(f)} = \frac{\sum_{i=1}^N \bar{Y}_i(f) \bar{U}_i^*(f)}{\sum_{i=1}^N \bar{U}_i(f) \bar{U}_i^*(f)}, \quad (13)$$

where \bar{U} and \bar{Y} indicate windowed Fourier coefficients of u and y .

In Matlab:

```
[H, hz] = tfestimate(u, y, window, noverlap, nfft, fs)
```

- ▶ **window**: shape of the window, normally **hann(nfft)**
- ▶ **noverlap**: number of overlap between frames (in samples)
- ▶ **nfft**: frame length in samples
- ▶ **fs**: sample frequency of **u** and **y**, to calculate frequency vector **hz**

Transfer function estimation:

$$H(f) \approx \frac{\sum_{i=1}^N S_{yu}^i(f)}{\sum_{i=1}^N S_{uu}^i(f)} = \frac{\sum_{i=1}^N \bar{Y}_i(f) \bar{U}_i^*(f)}{\sum_{i=1}^N \bar{U}_i(f) \bar{U}_i^*(f)}, \quad (13)$$

where \bar{U} and \bar{Y} indicate windowed Fourier coefficients of u and y .

In Matlab:

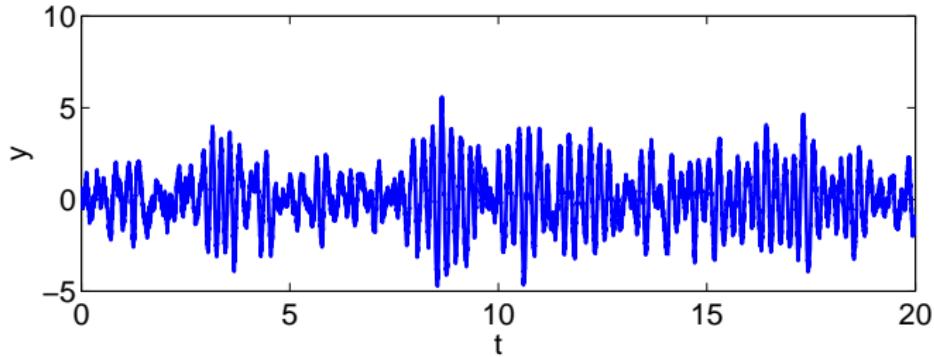

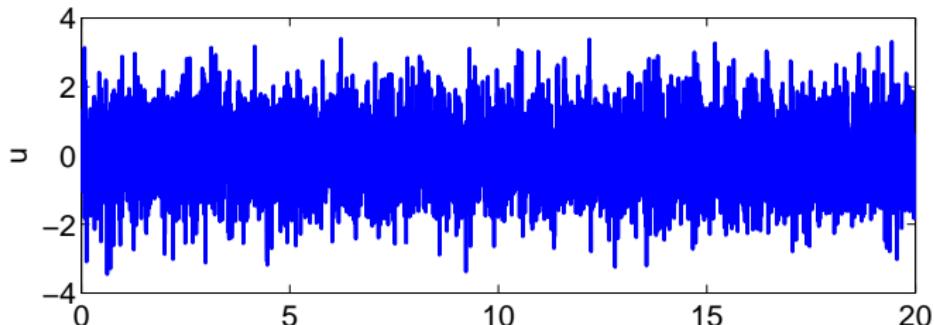

```
[H, hz] = tfestimate(u, y, window, noverlap, nfft, fs)
```

- ▶ **window**: shape of the window, normally **hann(nfft)**
- ▶ **noverlap**: number of overlap between frames (in samples)
- ▶ **nfft**: frame length in samples
- ▶ **fs**: sample frequency of **u** and **y**, to calculate frequency vector **hz**

Note: Frequency resolution = $fs/nfft$ Hz

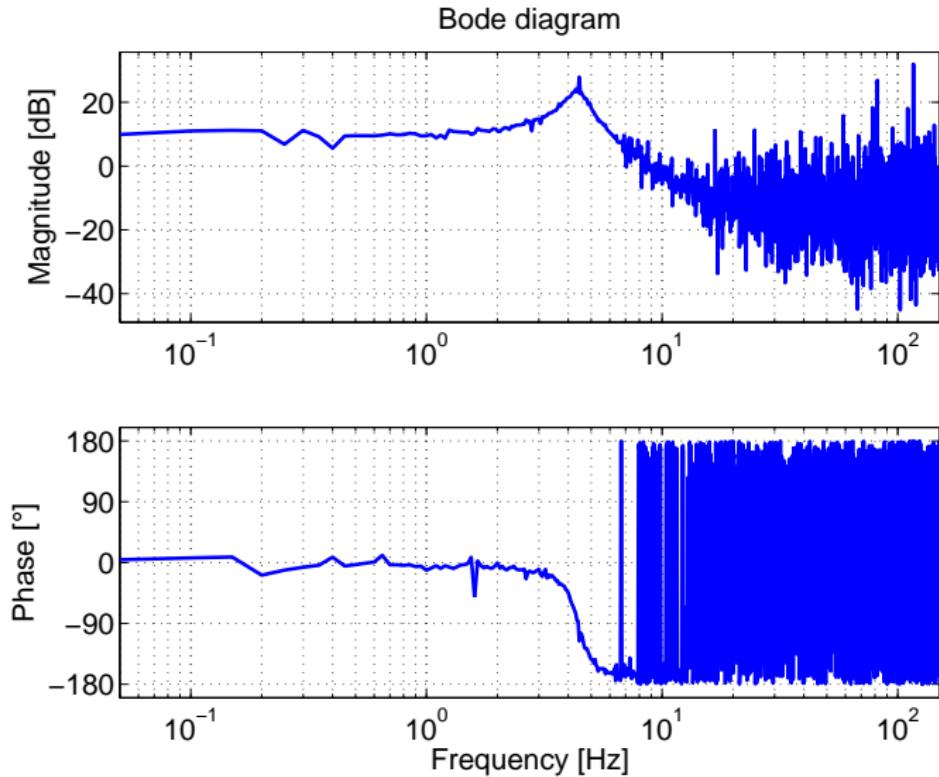

Estimating the transfer function: example

- ▶ 20 seconds of input- and output-data
- ▶ sampled with 300Hz

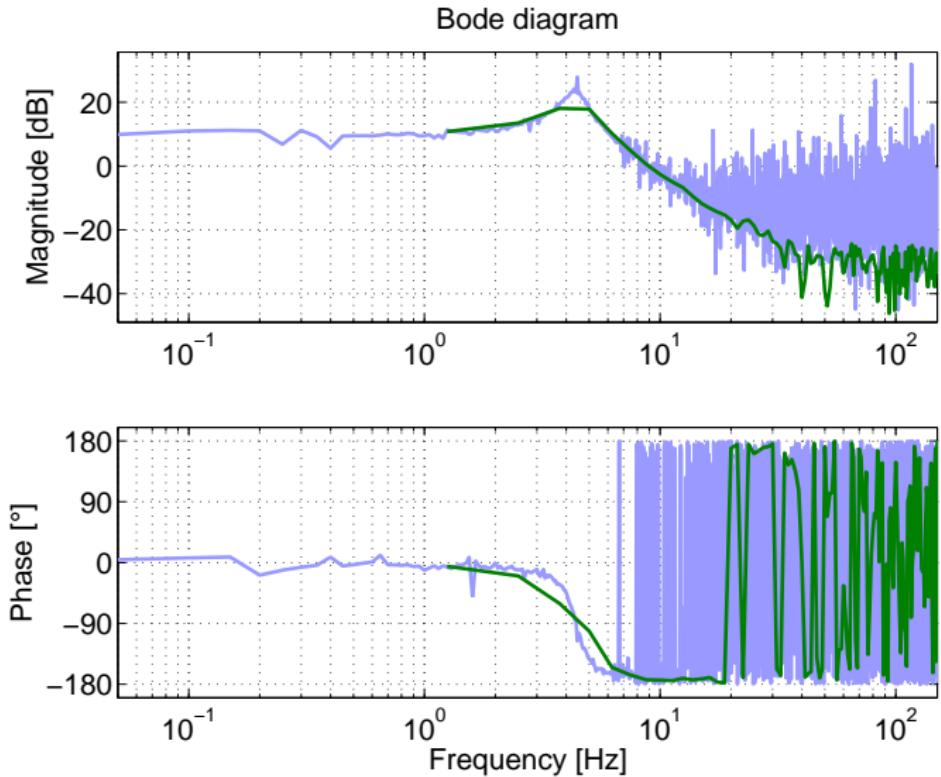

Estimating the transfer function: example

- ▶ frame length = 6000 (20s)
- ▶ 1 frame
- ▶ Resolution: 0.05Hz

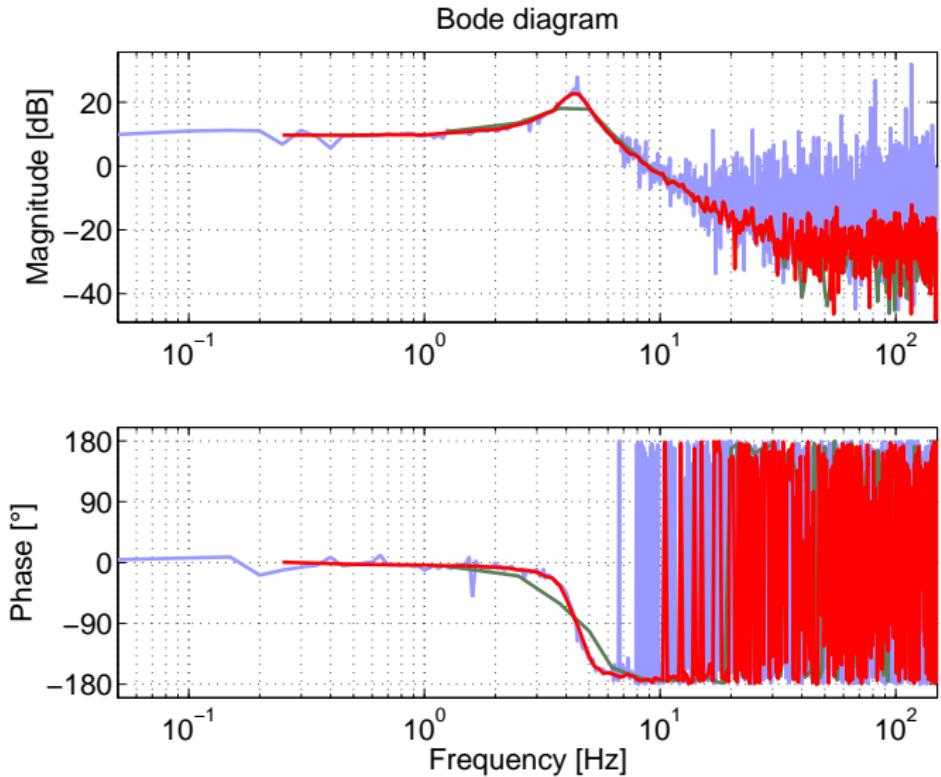

Estimating the transfer function: example

- ▶ frame length = 240 (0.8s)
- ▶ 49 frames
- ▶ Resolution: 1.25Hz

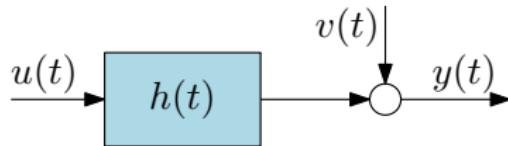

Estimating the transfer function: example

- ▶ frame length = 1200 (4s)
- ▶ 9 frames
- ▶ Resolution: 0.25Hz

What about the quality of the measurement?

How reliable is our measurement?

$$Y(f) = H(f)U(f) + V(f)$$

$$Y(f)Y^*(f) = H(f)U(f)Y^*(f) + V(f)Y^*(f)$$

$$S_{yy}(f) = H(f)S_{uy}(f) + \underbrace{S_{vy}(f)}_{??}$$

Quality is determined by $S_{vy}(f)$:

- ▶ minimal when $|S_{yy}(f)| = |H(f)S_{uy}(f)|$
- ▶ when output power can be explained by plant

This motivates the idea behind the *coherence function*:

$$C(f) = \left| \frac{H(f)S_{uy}(f)}{S_{yy}(f)} \right| = \left| \frac{S_{yu}(f)S_{uy}(f)}{S_{uu}(f)S_{yy}(f)} \right| = |H(f)|^2 \frac{S_{uu}(f)}{S_{yy}(f)}$$

(where we assumed that $S_{uv}(f) = 0$).

This motivates the idea behind the *coherence function*:

$$C(f) = \left| \frac{H(f)S_{uy}(f)}{S_{yy}(f)} \right| = \left| \frac{S_{yu}(f)S_{uy}(f)}{S_{uu}(f)S_{yy}(f)} \right| = |H(f)|^2 \frac{S_{uu}(f)}{S_{yy}(f)}$$

(where we assumed that $S_{uv}(f) = 0$).

More precisely, when averaging is used:

$$\begin{aligned} C(f) &= \left| \frac{\sum_{i=1}^N S_{yu}^i(f) \cdot \sum_{i=1}^N S_{uy}^i(f)}{\sum_{i=1}^N S_{uu}^i(f) \cdot \sum_{i=1}^N S_{yy}^i(f)} \right| \\ &= \left| \frac{\left(\sum_{i=1}^N \bar{Y}_i(f) \bar{U}_i^*(f) \right)^2}{\sum_{i=1}^N \bar{U}_i(f) \bar{U}_i^*(f) \cdot \sum_{i=1}^N \bar{Y}_i(f) \bar{Y}_i^*(f)} \right| \end{aligned} \quad (14)$$

$$C(f) = \left| \frac{\sum_{i=1}^N S_{yu}^i(f) \cdot \sum_{i=1}^N S_{uy}^i(f)}{\sum_{i=1}^N S_{uu}^i(f) \cdot \sum_{i=1}^N S_{yy}^i(f)} \right|$$

When is a measurement reliable?

- ▶ when each data serie in N yields the same PSD's
 - i.e. when $S_{..}^i(f) \approx S_{..}^j(f)$ for all $i \neq j$
- ▶ then $C(f) \approx 1$
 - i.e. then relation from u to y is mostly linear for that f

$$C(f) = \left| \frac{\sum_{i=1}^N S_{yu}^i(f) \cdot \sum_{i=1}^N S_{uy}^i(f)}{\sum_{i=1}^N S_{uu}^i(f) \cdot \sum_{i=1}^N S_{yy}^i(f)} \right|$$

When is a measurement reliable?

- ▶ when each data serie in N yields the same PSD's
 - i.e. when $S_{..}^i(f) \approx S_{..}^j(f)$ for all $i \neq j$
- ▶ then $C(f) \approx 1$
 - i.e. then relation from u to y is mostly linear for that f

Hence, when $C(f) < 1$ at a certain f , there are

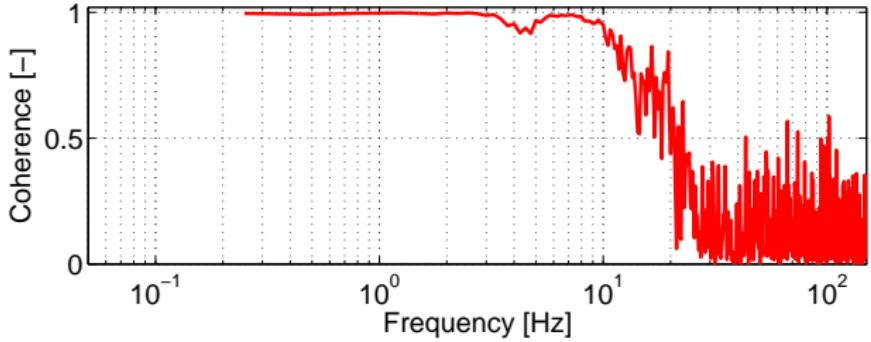

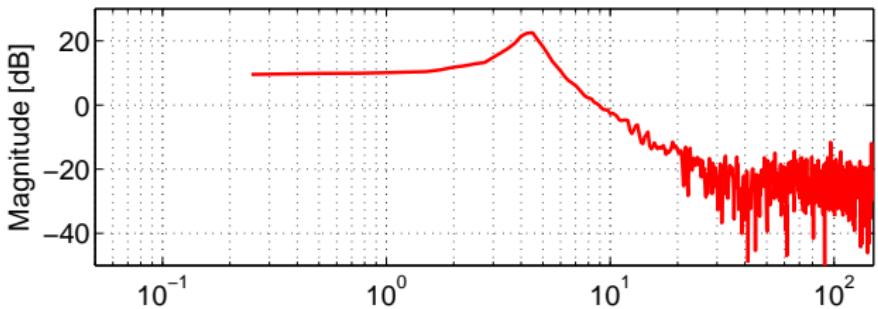

- ▶ non-linearities in $H(f)$
- ▶ dominant (measurement) noise sources
- ▶ other disturbances or inputs present in y

Coherence: example

Coherence
 \Updownarrow
signal-to-noise ratio

$C(f) < 1$ if

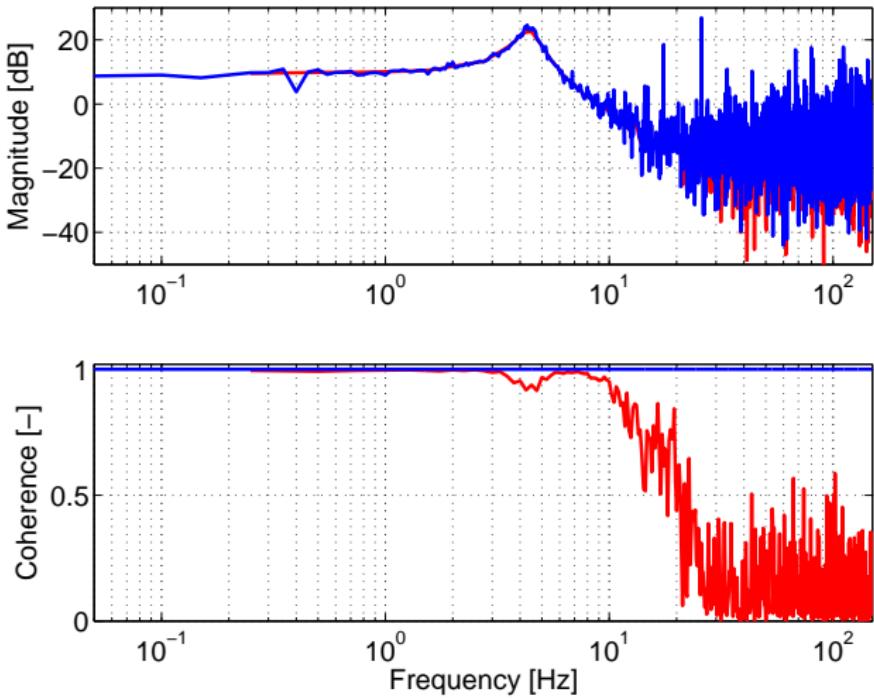

- ▶ noise is large
- ▶ ‘signal’ is small

Coherence: example

If $N = 1$

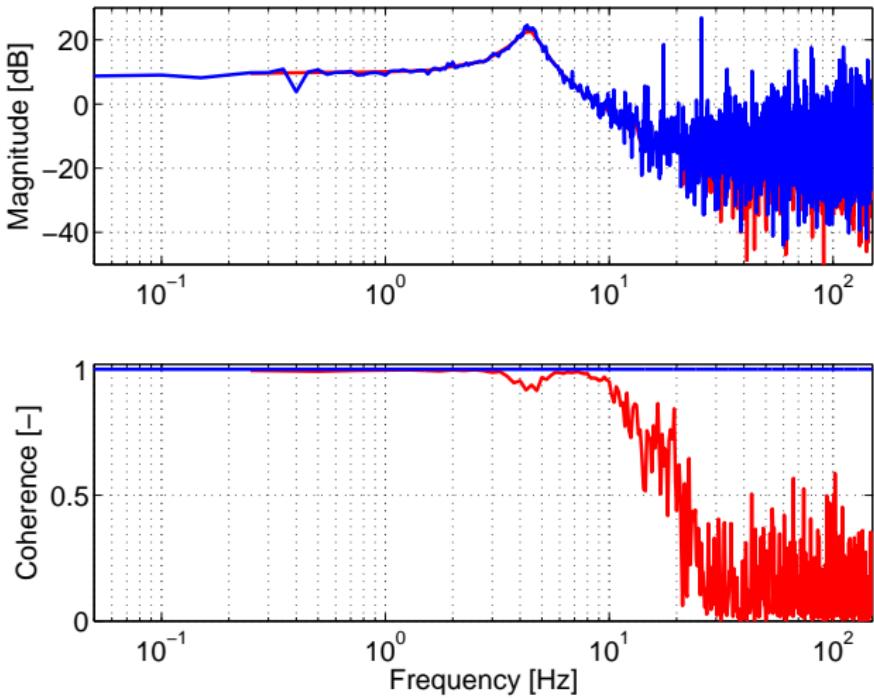

- ▶ just one frame
- ▶ no averaging
- ▶ noise is seen as linear dynamics
- ▶ $C(f) = 1$ for all f

Coherence: example

If $N = 1$

- ▶ just one frame
- ▶ no averaging
- ▶ noise is seen as linear dynamics
- ▶ $C(f) = 1$ for all f

Coherence is not ‘holy’: handle with care!

Can we also measure in
closed loop?

Open loop measurements of the plant not always a good idea:

- ▶ when plant is unstable
- ▶ when plant movement is restricted

Then plant has to be controlled before an experiment can take place.

Open loop measurements of the plant not always a good idea:

- ▶ when plant is unstable
- ▶ when plant movement is restricted

Then plant has to be controlled before an experiment can take place.

Solution: Indirect closed loop measurement:

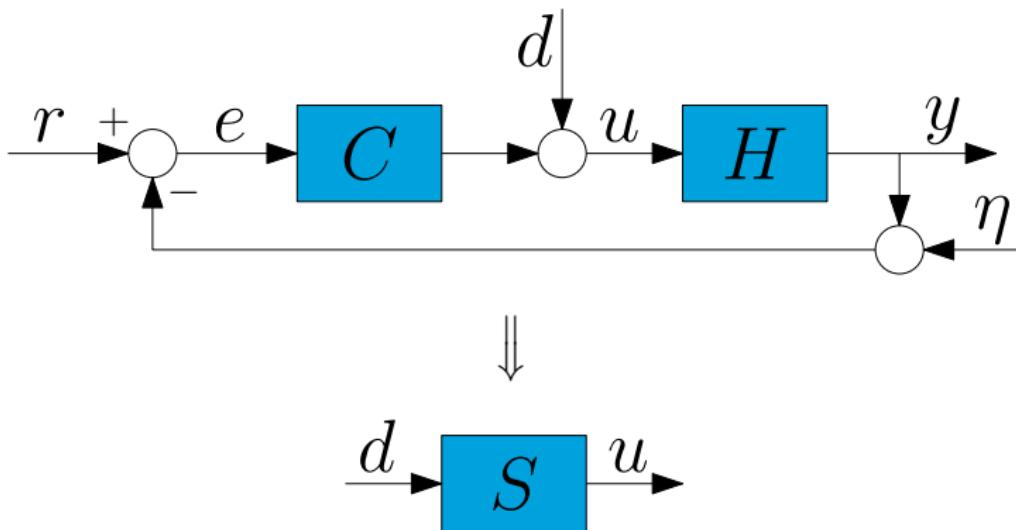

- ▶ Given any stabilizing controller
- ▶ Measure closed loop transfer function
 - e.g. Sensitivity or Process Sensitivity
- ▶ Derive plant $H(f)$ or open loop $C(f)H(f)$ from that

Indirect method: two-point

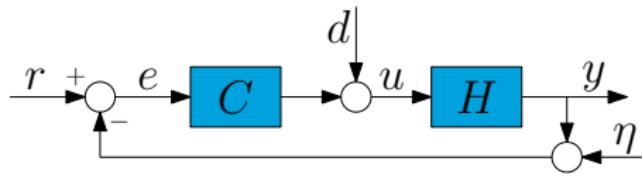

44/60

Two-point measurement:

- ▶ measure Sensitivity directly, then derive open-loop
- ▶ apply disturbance d , measure u

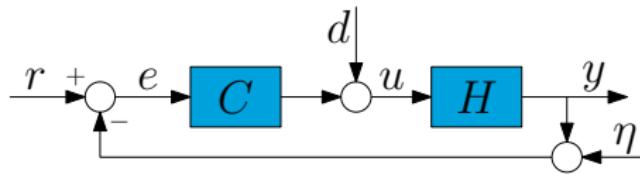

Indirect method: two-point

$$\begin{aligned}U(f) &= D(f) + C(f)R(f) - C(f)N(f) - C(f)H(f)U(f) \\S_{ud}(f) &= S_{dd}(f) + C(f)S_{rd}(f) - C(f)S_{\eta d}(f) - C(f)H(f)S_{ud}(f) \\&= \frac{1}{1 + C(f)H(f)}S_{dd}(f) + \frac{C(f)}{1 + C(f)H(f)} [S_{rd}(f) - S_{\eta d}(f)]\end{aligned}$$

Indirect method: two-point

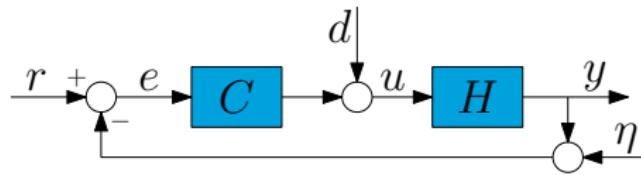

$$\begin{aligned}U(f) &= D(f) + C(f)R(f) - C(f)N(f) - C(f)H(f)U(f) \\S_{ud}(f) &= S_{dd}(f) + C(f)S_{rd}(f) - C(f)S_{\eta d}(f) - C(f)H(f)S_{ud}(f) \\&= \frac{1}{1 + C(f)H(f)}S_{dd}(f) + \frac{C(f)}{1 + C(f)H(f)} [S_{rd}(f) - S_{\eta d}(f)]\end{aligned}$$

When r , d and η are uncorrelated:

$$S(f) = \frac{1}{1 + C(f)H(f)} \approx \frac{S_{ud}(f)}{S_{dd}(f)}$$

Indirect method: two-point

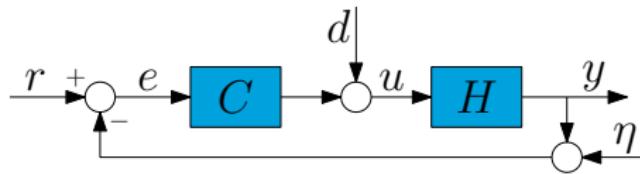

Or when averaging is used (as usual):

$$S(f) = \frac{1}{1 + C(f)H(f)} \approx \frac{\sum_{i=1}^N S_{ud}^i(f)}{\sum_{i=1}^N S_{dd}^i(f)}$$

Indirect method: two-point

46/60

Or when averaging is used (as usual):

$$S(f) = \frac{1}{1 + C(f)H(f)} \approx \frac{\sum_{i=1}^N S_{ud}^i(f)}{\sum_{i=1}^N S_{dd}^i(f)}$$

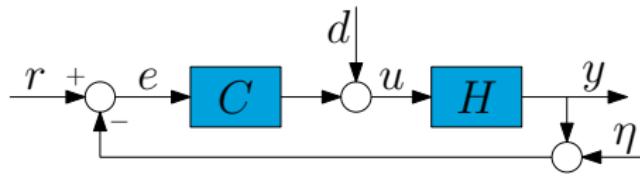

Then the open-loop is:

$$L(f) = C(f)H(f) = S^{-1}(f) - 1$$

And since $C(f)$ is known (or can be measured):

$$H(f) = C^{-1}(f) [S^{-1}(f) - 1]$$

Indirect method: two-point

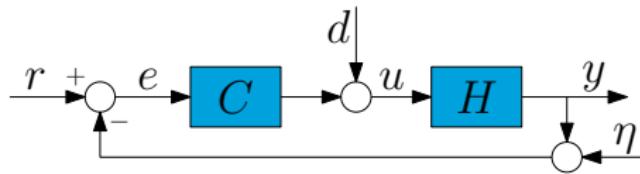

How to obtain $S_{rd}(f) \approx 0$ and $S_{\eta d}(f) \approx 0$?

- ▶ choose $r = 0$
- ▶ choose d as white noise

Indirect method: two-point

47/60

How to obtain $S_{rd}(f) \approx 0$ and $S_{\eta d}(f) \approx 0$?

- ▶ choose $r = 0$
- ▶ choose d as white noise

Otherwise

$$S_{ud}(f) = \frac{1}{1 + C(f)H(f)} S_{dd}(f) + \underbrace{\frac{C(f)}{1 + C(f)H(f)} [S_{rd}(f) - S_{\eta d}(f)]}_{\text{bias}}$$

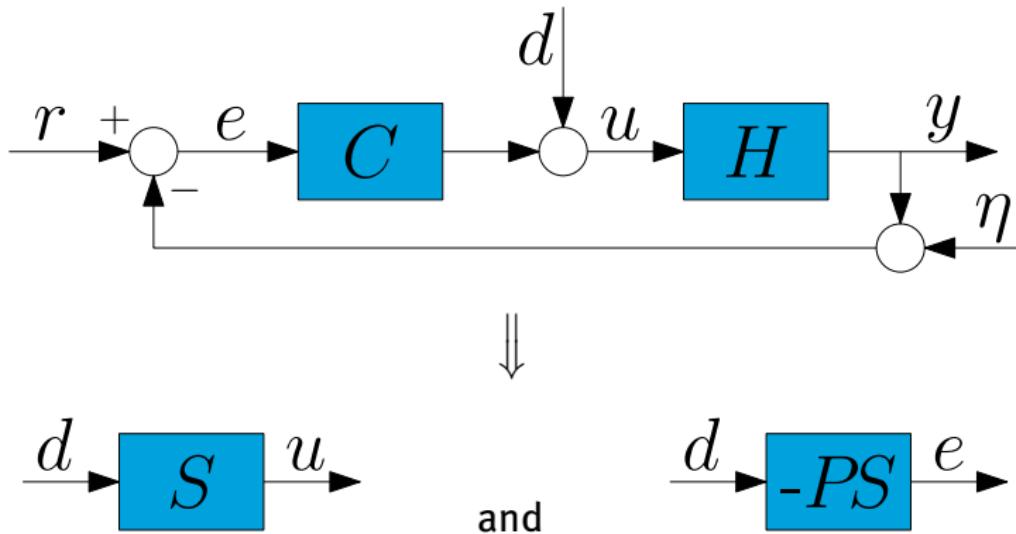

Results in a wrong estimation of the Sensitivity $S(f)$.

Department of Mechanical Engineering

Indirect method: three-point

48/60

What if $C(f)$ is not (exactly) known?

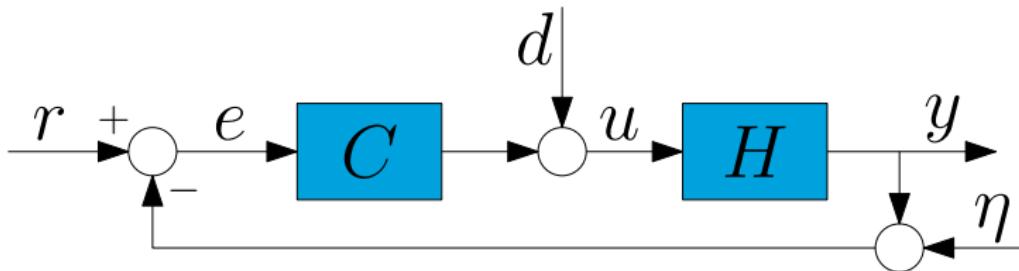

- ▶ measure both Sensitivity and Process Sensitivity directly
- ▶ apply d , measure both u and e (or y)

Indirect method: three-point

49/60

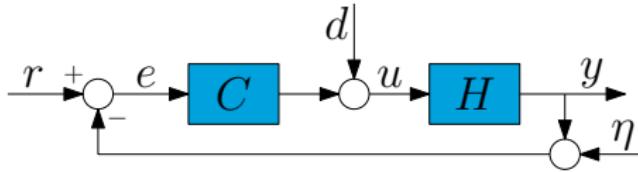

What if $C(f)$ is not (exactly) known?

$$\left. \begin{array}{l} \frac{u}{d} = S(f) \\ \frac{e}{d} = -PS(f) \end{array} \right\} \Rightarrow \frac{PS(f)}{S(f)} = \frac{H(f)}{1 + C(f)H(f)} \cdot \frac{1 + C(f)H(f)}{1} = H(f)$$

- ▶ No (separate) measurement of $C(f)$ necessary
- ▶ Check coherence of both $d \rightarrow u$ and $d \rightarrow e$

Note: make sure that r , d and η are uncorrelated
Be aware of **bias** otherwise!

Some people are tempted to do a direct measurement in closed loop...

- ▶ apply d , measure u and y , calculate $H(f) = \frac{S_{yu}(f)}{S_{uu}(f)}$

Problem: η and u are *correlated*:

$$S_{yu}(f) = S_{\eta u}(f) + H(f)S_{uu}(f), \quad S_{\eta u}(f) \neq 0,$$

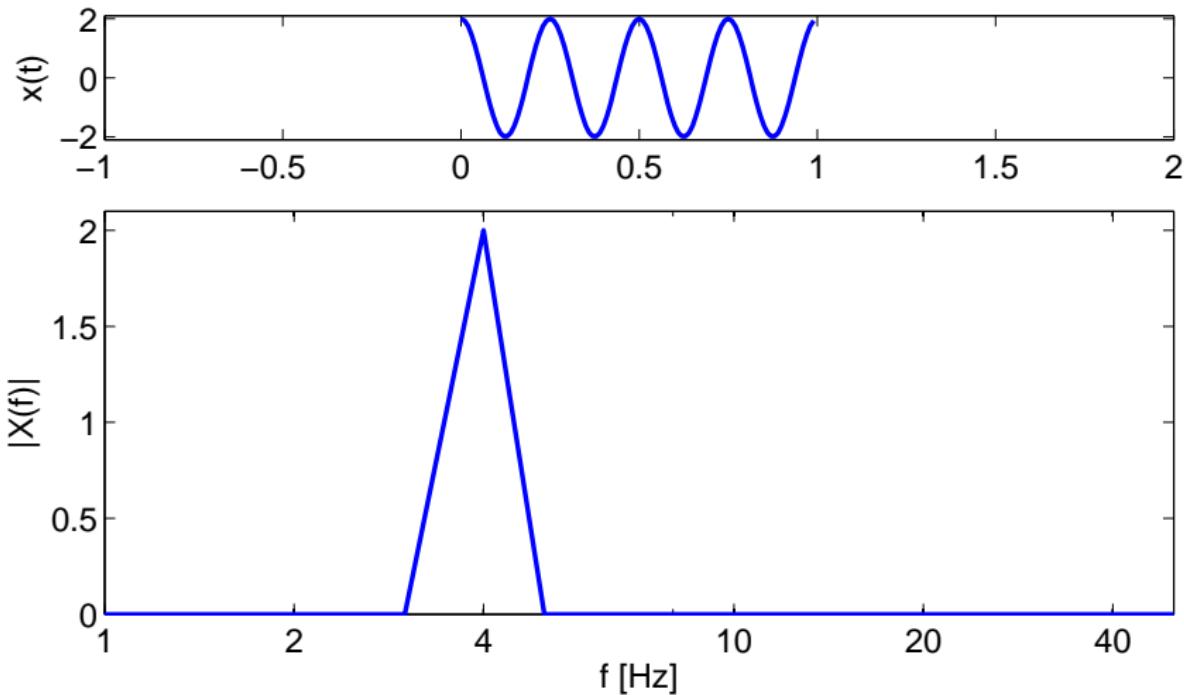

since $U(f) = D(f) - C(f)N(f) - C(f)H(f)U(f)$ we have

$$S_{u\eta}(f) = S(f)S_{d\eta}(f) - CS(f)S_{\eta\eta}(f) \quad S_{d\eta}(f) \approx 0$$

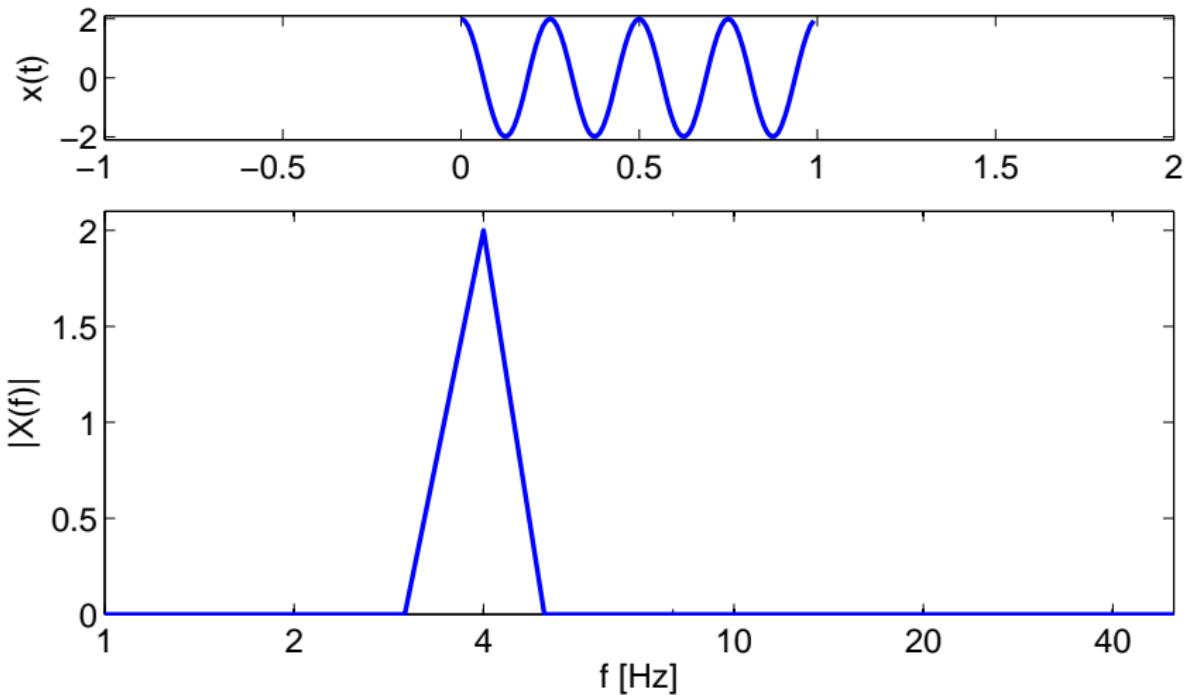

$$S_{yu}(f) = H(f)S_{uu}(f) - \underbrace{CS(f)S_{\eta\eta}(f)}_{\text{bias}}$$

Practical tricks and issues to be aware of

Suppose: $x(t) = A \cos(2\pi ft)$, with $t \in [0, T]$ and $f \cdot T$ an integer

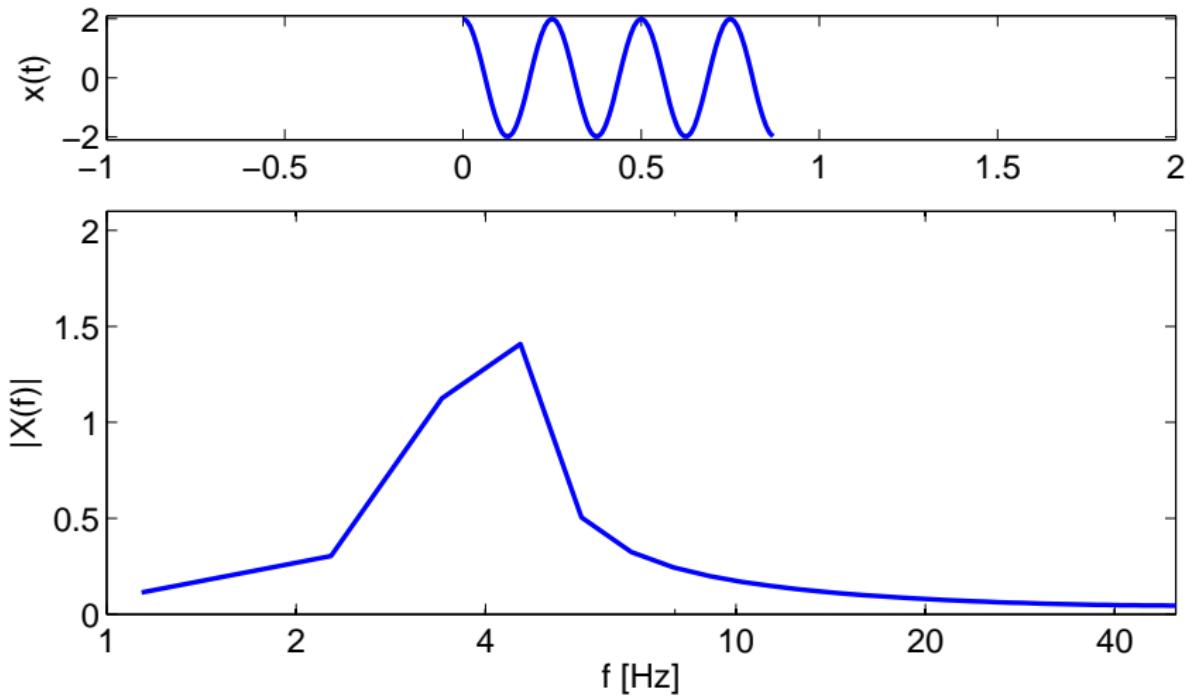

Suppose: $x(t) = A \cos(2\pi ft)$, with $t \in [0, T]$ and $f \cdot T$ an integer

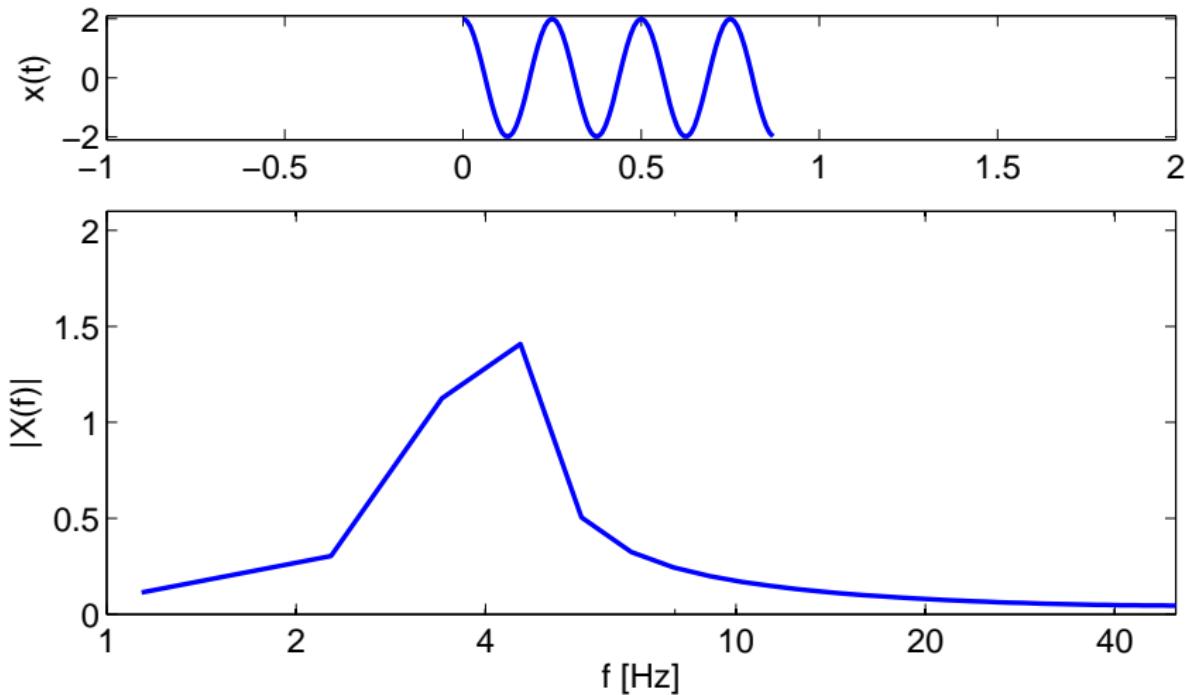

Only then $x(t)$ is exactly periodic: spectrum is exact.

Suppose: $x(t) = A \cos(2\pi ft)$, with $t \in [0, T]$ and T is random

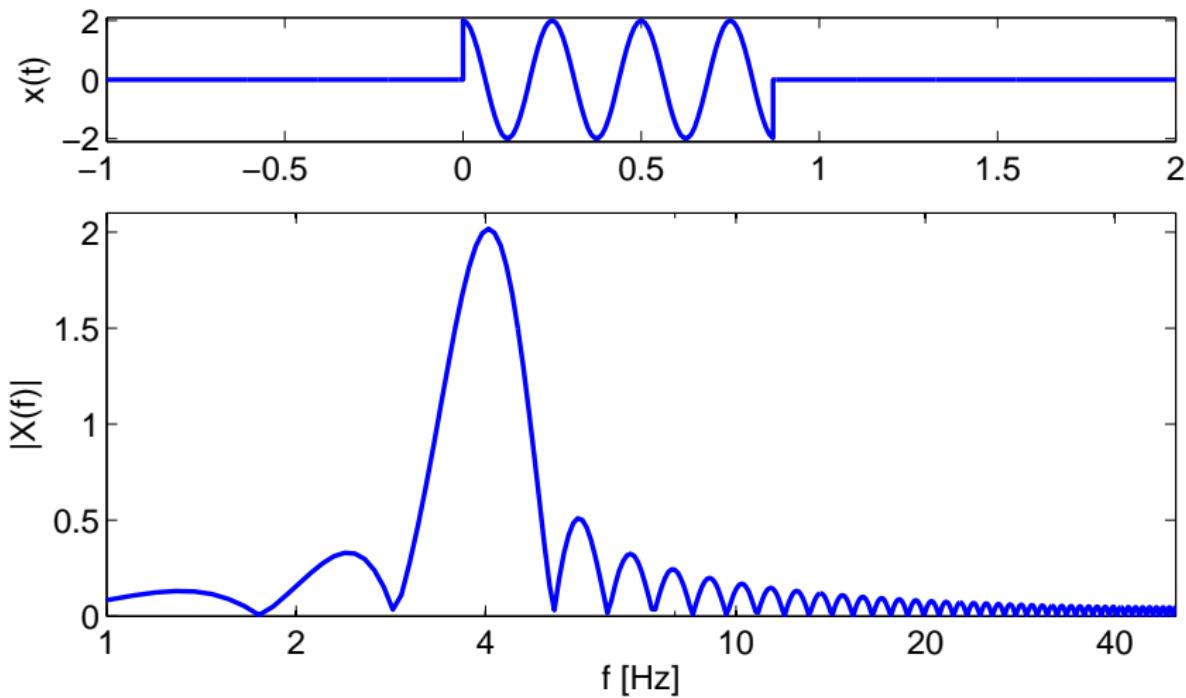

Suppose: $x(t) = A \cos(2\pi ft)$, with $t \in [0, T]$ and T is random

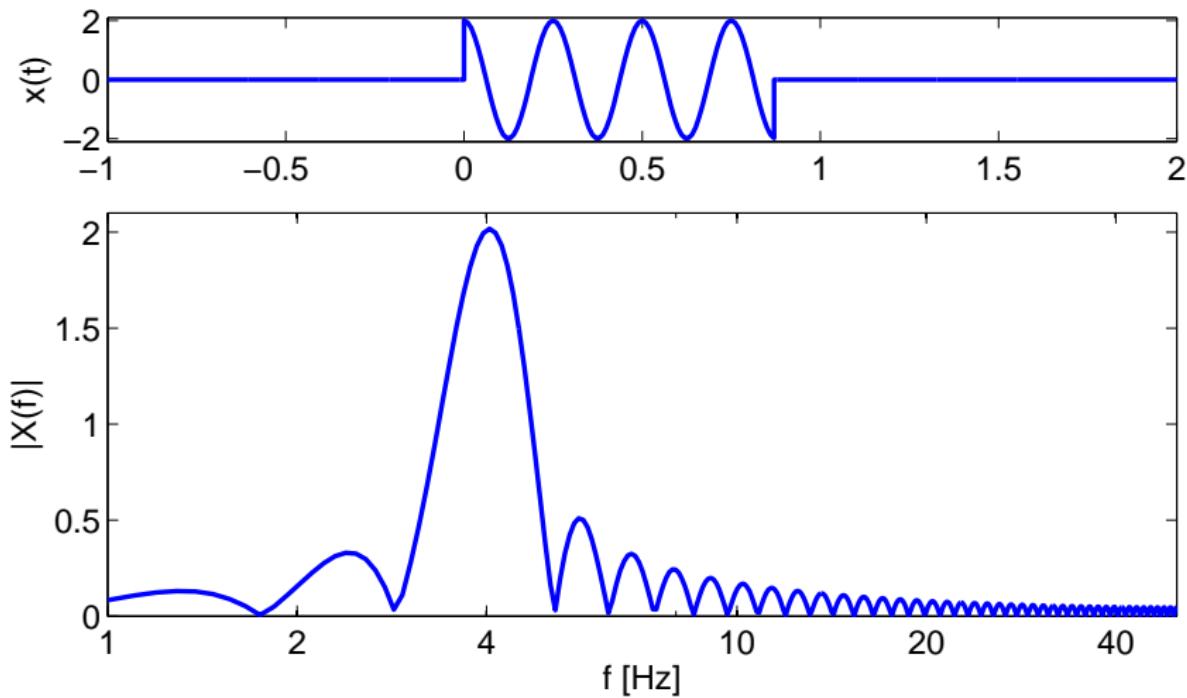

Then f is not part of spectrum ($x(t)$ is aperiodic): *leakage*.

Solution: add zeros to increase frequency resolution

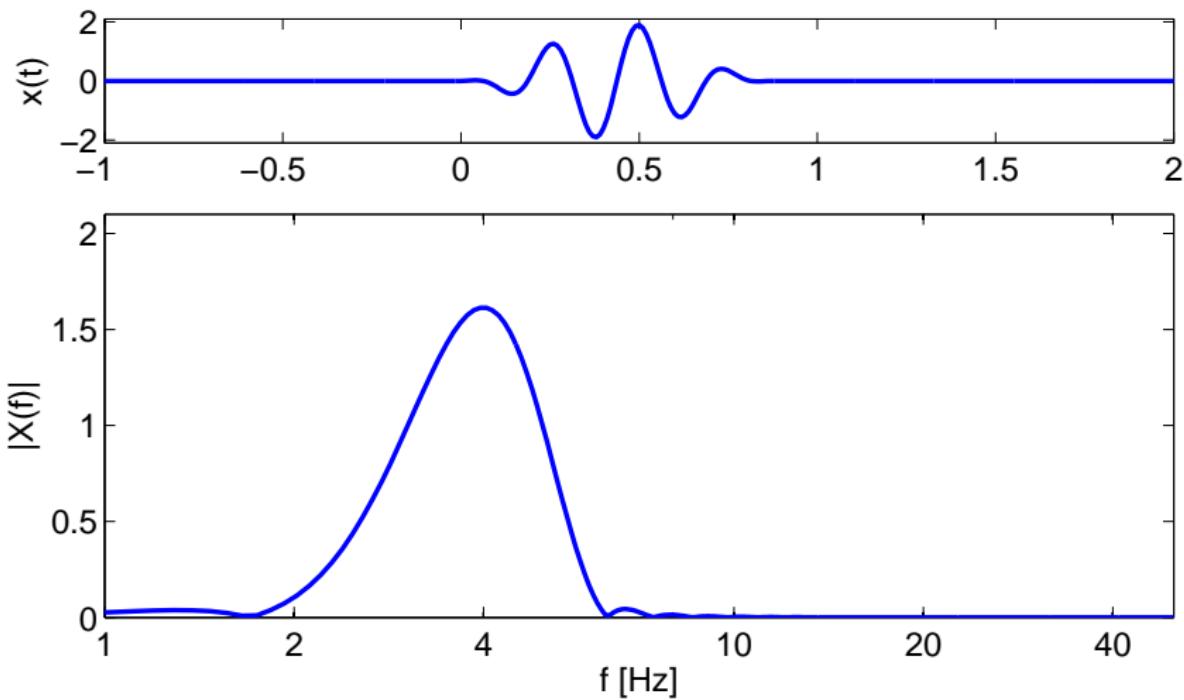

Solution: add zeros to increase frequency resolution

Zero-padding increases resolution, but introduces *ripple*.

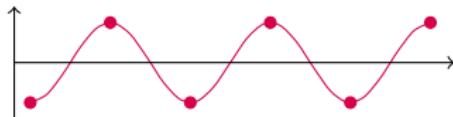

Solution: apply window to remove jumps in time-signal

Reduced ripple and leakage, but spectrum is still not exact.

In practice signals are sampled with sample frequency F_s

- ▶ at least two samples are needed to identify an harmonic:

Highest frequency recognized in Fourier analysis is thus $F_s/2$

- ▶ $F_s/2$ is known as the *Nyquist frequency*

In practice signals are sampled with sample frequency F_s

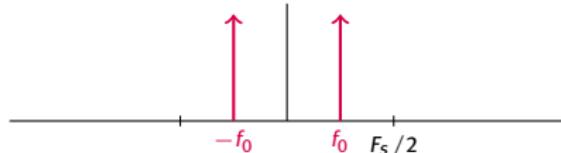

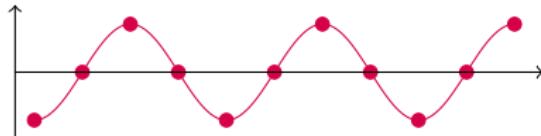

- at least two samples are needed to identify an harmonic:

Highest frequency recognized in Fourier analysis is thus $F_s/2$

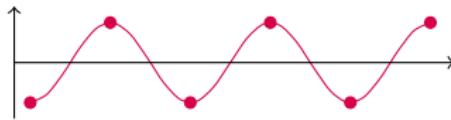

- $F_s/2$ is known as the *Nyquist frequency*

Spectrum for sampled signals is repetitive

In practice signals are sampled with sample frequency F_s

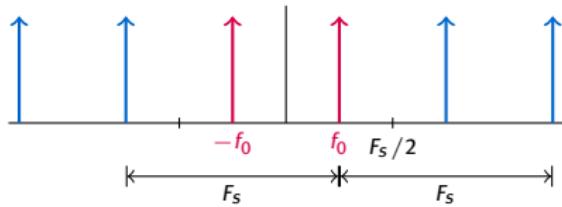

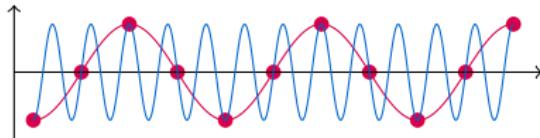

- at least two samples are needed to identify an harmonic:

Highest frequency recognized in Fourier analysis is thus $F_s/2$

- $F_s/2$ is known as the *Nyquist frequency*

Spectrum for sampled signals is repetitive

In practice signals are sampled with sample frequency F_s

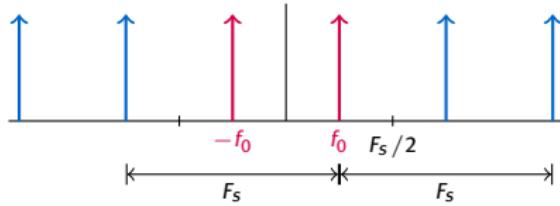

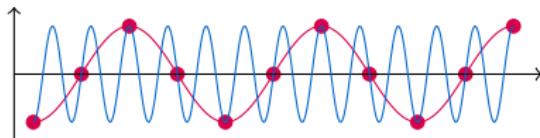

- at least two samples are needed to identify an harmonic:

Highest frequency recognized in Fourier analysis is thus $F_s/2$

- $F_s/2$ is known as the *Nyquist frequency*

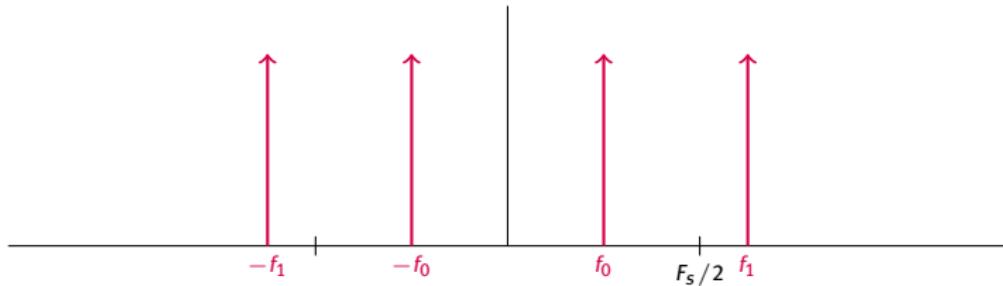

Spectrum for sampled signals is repetitive

- only frequencies between $-F_s/2$ and $F_s/2$ are relevant

What happens if frequencies higher than $F_s/2$ are present?

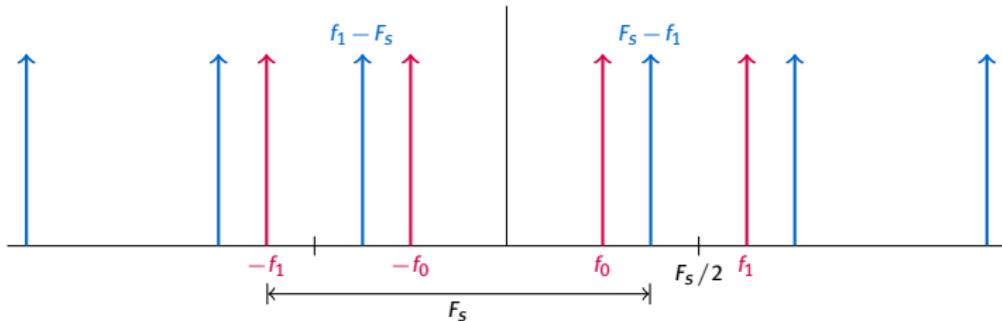

- ▶ these frequencies are mapped (or folded) to lower frequencies

Note: Aliased frequencies will change when sample frequency F_s changes, while f_0 remains the same. This can be used to check whether aliasing occurs.

What happens if frequencies higher than $F_s/2$ are present?

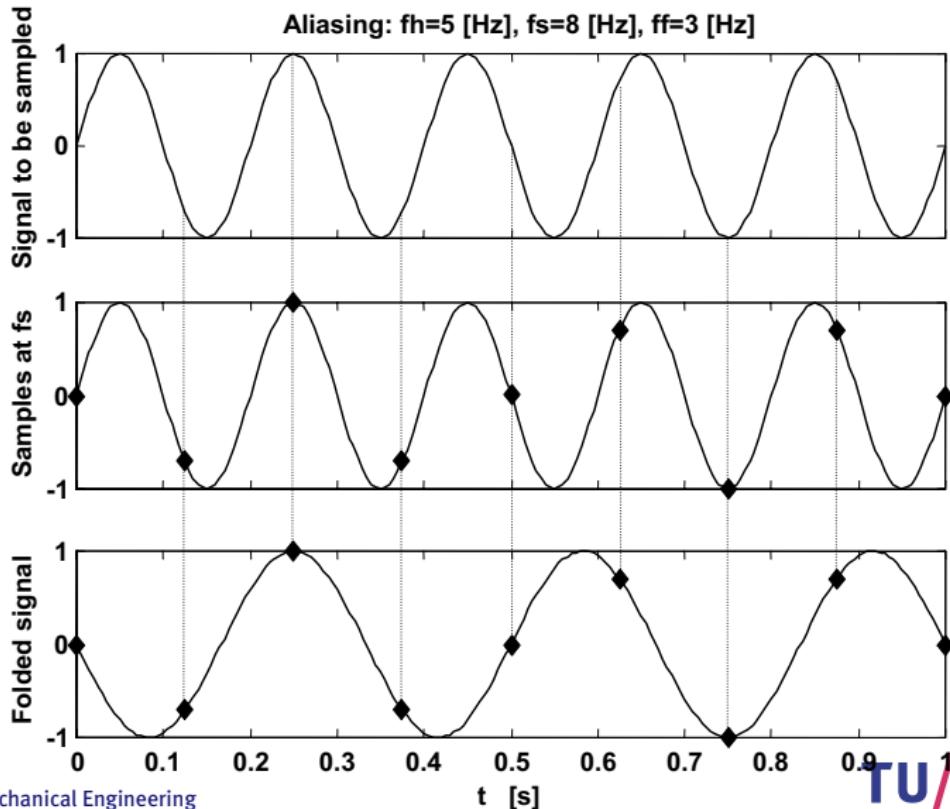

- ▶ these frequencies are mapped (or folded) to lower frequencies

- ▶ Hence, f_1 is wrongly identified as $F_s - f_1$

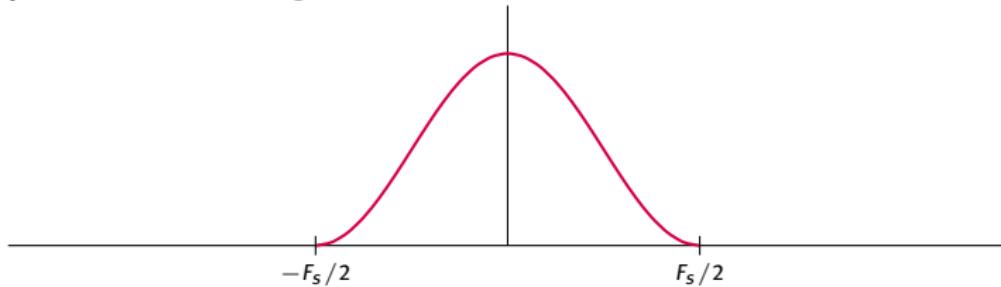

Note: Aliased frequencies will change when sample frequency F_s changes, while f_0 remains the same. This can be used to check whether aliasing occurs.

What does that mean in time domain?

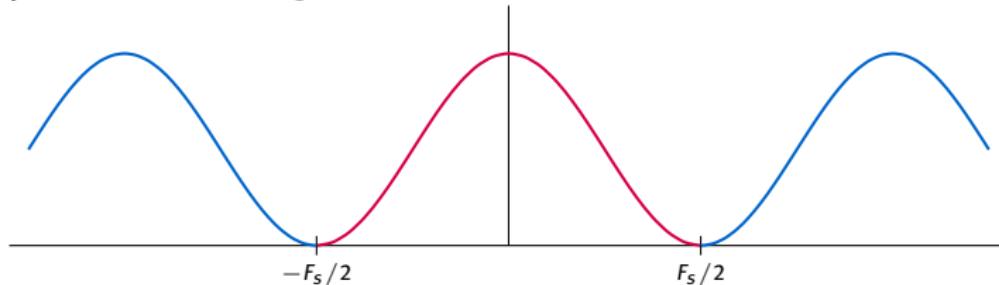

Hence, to prevent aliasing:

- ▶ Sampling frequency should be at least *twice* the highest frequency present in the signal

Hence, to prevent aliasing:

- ▶ Sampling frequency should be at least *twice* the highest frequency present in the signal

- ▶ Known as *Shannon* sampling theorem

And now it's your turn!
